DAM SAFETY

ABOVE: View looking downstream through the breached area at the outlet section of the dam. Survey rod (indicated by arrow) is placed at the downstream end of the outlet. Note parts of the cutoff collars are visible along the path of the outlet conduit. Note large eroded area to the left of the outlet, and main breach to the right of the outlet.

RIGHT: View looking upstream through breached area of dam back towards reservoir. Note beavers are in the process of damming the breached area.

DAM SAFETY

ABOVE: View looking across spillway channel at the left abutment back towards the dam and reservoir. Note beaver dam (circled) constructed in spillway channel. The beaver dam corresponds to station 0+40 on the spillway profile. Note brush and tree growth on, and near, the dam in the background.

RIGHT: View of remains of old eroded animal burrow (indicated by arrows) at crest of dam. This view is from the upstream slope of the dam, looking across the crest, towards area below dam. This particular eroded burrow went all the way through the crest towards the downstream slope. The survey rod is placed on the approximate centerline of the dam crest. There was about an 8 inch width of original dam crest left below the survey rod, with the burrow being eroded all the way through. Georgia is standing in the eroded burrow, downstream of the survey rod. Also note tree growth visible along the right edge of this view.
