NARRATIVE AND SYSTEM DESCRIPTION, 02-07416

from B/U exam Cyt

A Snake River pumping plant with 30 HP pump is used to replenish historic water levels in Bruneau Sand Dunes Lakes. The pump is operational nearly continually during the non-irrigation season, 10/1 to 5/15, to re-fill and maintain the lakes, which are a series of pools derived from physically enhanced natural depressions, and linked by culverts and channels. The lakes were originally fully charged by spring flows. As a result of long-term drought, spring flow has diminished to the point that the shallower pools had dried and the established fishery in the larger pools was jeopardized. Under this permit, there is little to no exiting flow from the area; much of the incoming flow is spent on recharge seepage and evaporation. *Some marshy areas at end of system capture some seepage flows - these shown as "Rec/Wild" only on P/U.* A buried aqueduct delivers water from the pumping plant to a concrete outlet box at the north end of the lakes. Starting with 16" diameter PVC pipe, the aqueduct runs 2.6 miles (13,800 feet) with three uniform size reductions to 10" pipe at the outlet. An 18" Cippoletti weir is installed in the outlet box and a measurement was taken during the exam.

Permit overlaps and is used with 51-02157 and -02249, licenses which cover live flow and storage for recreation and wildlife uses from the springs which arise in the lake beds and just above the shoreline. 51-02249 was issued for storage of 6500 AF in the lakes; I believe this is in excess of the historical capacity of the lakes, even if a surface area reduction due to drought is taken into account. Estimated total lake capacity, based on 2249 license exam and my visit, is:

→ others insignificant

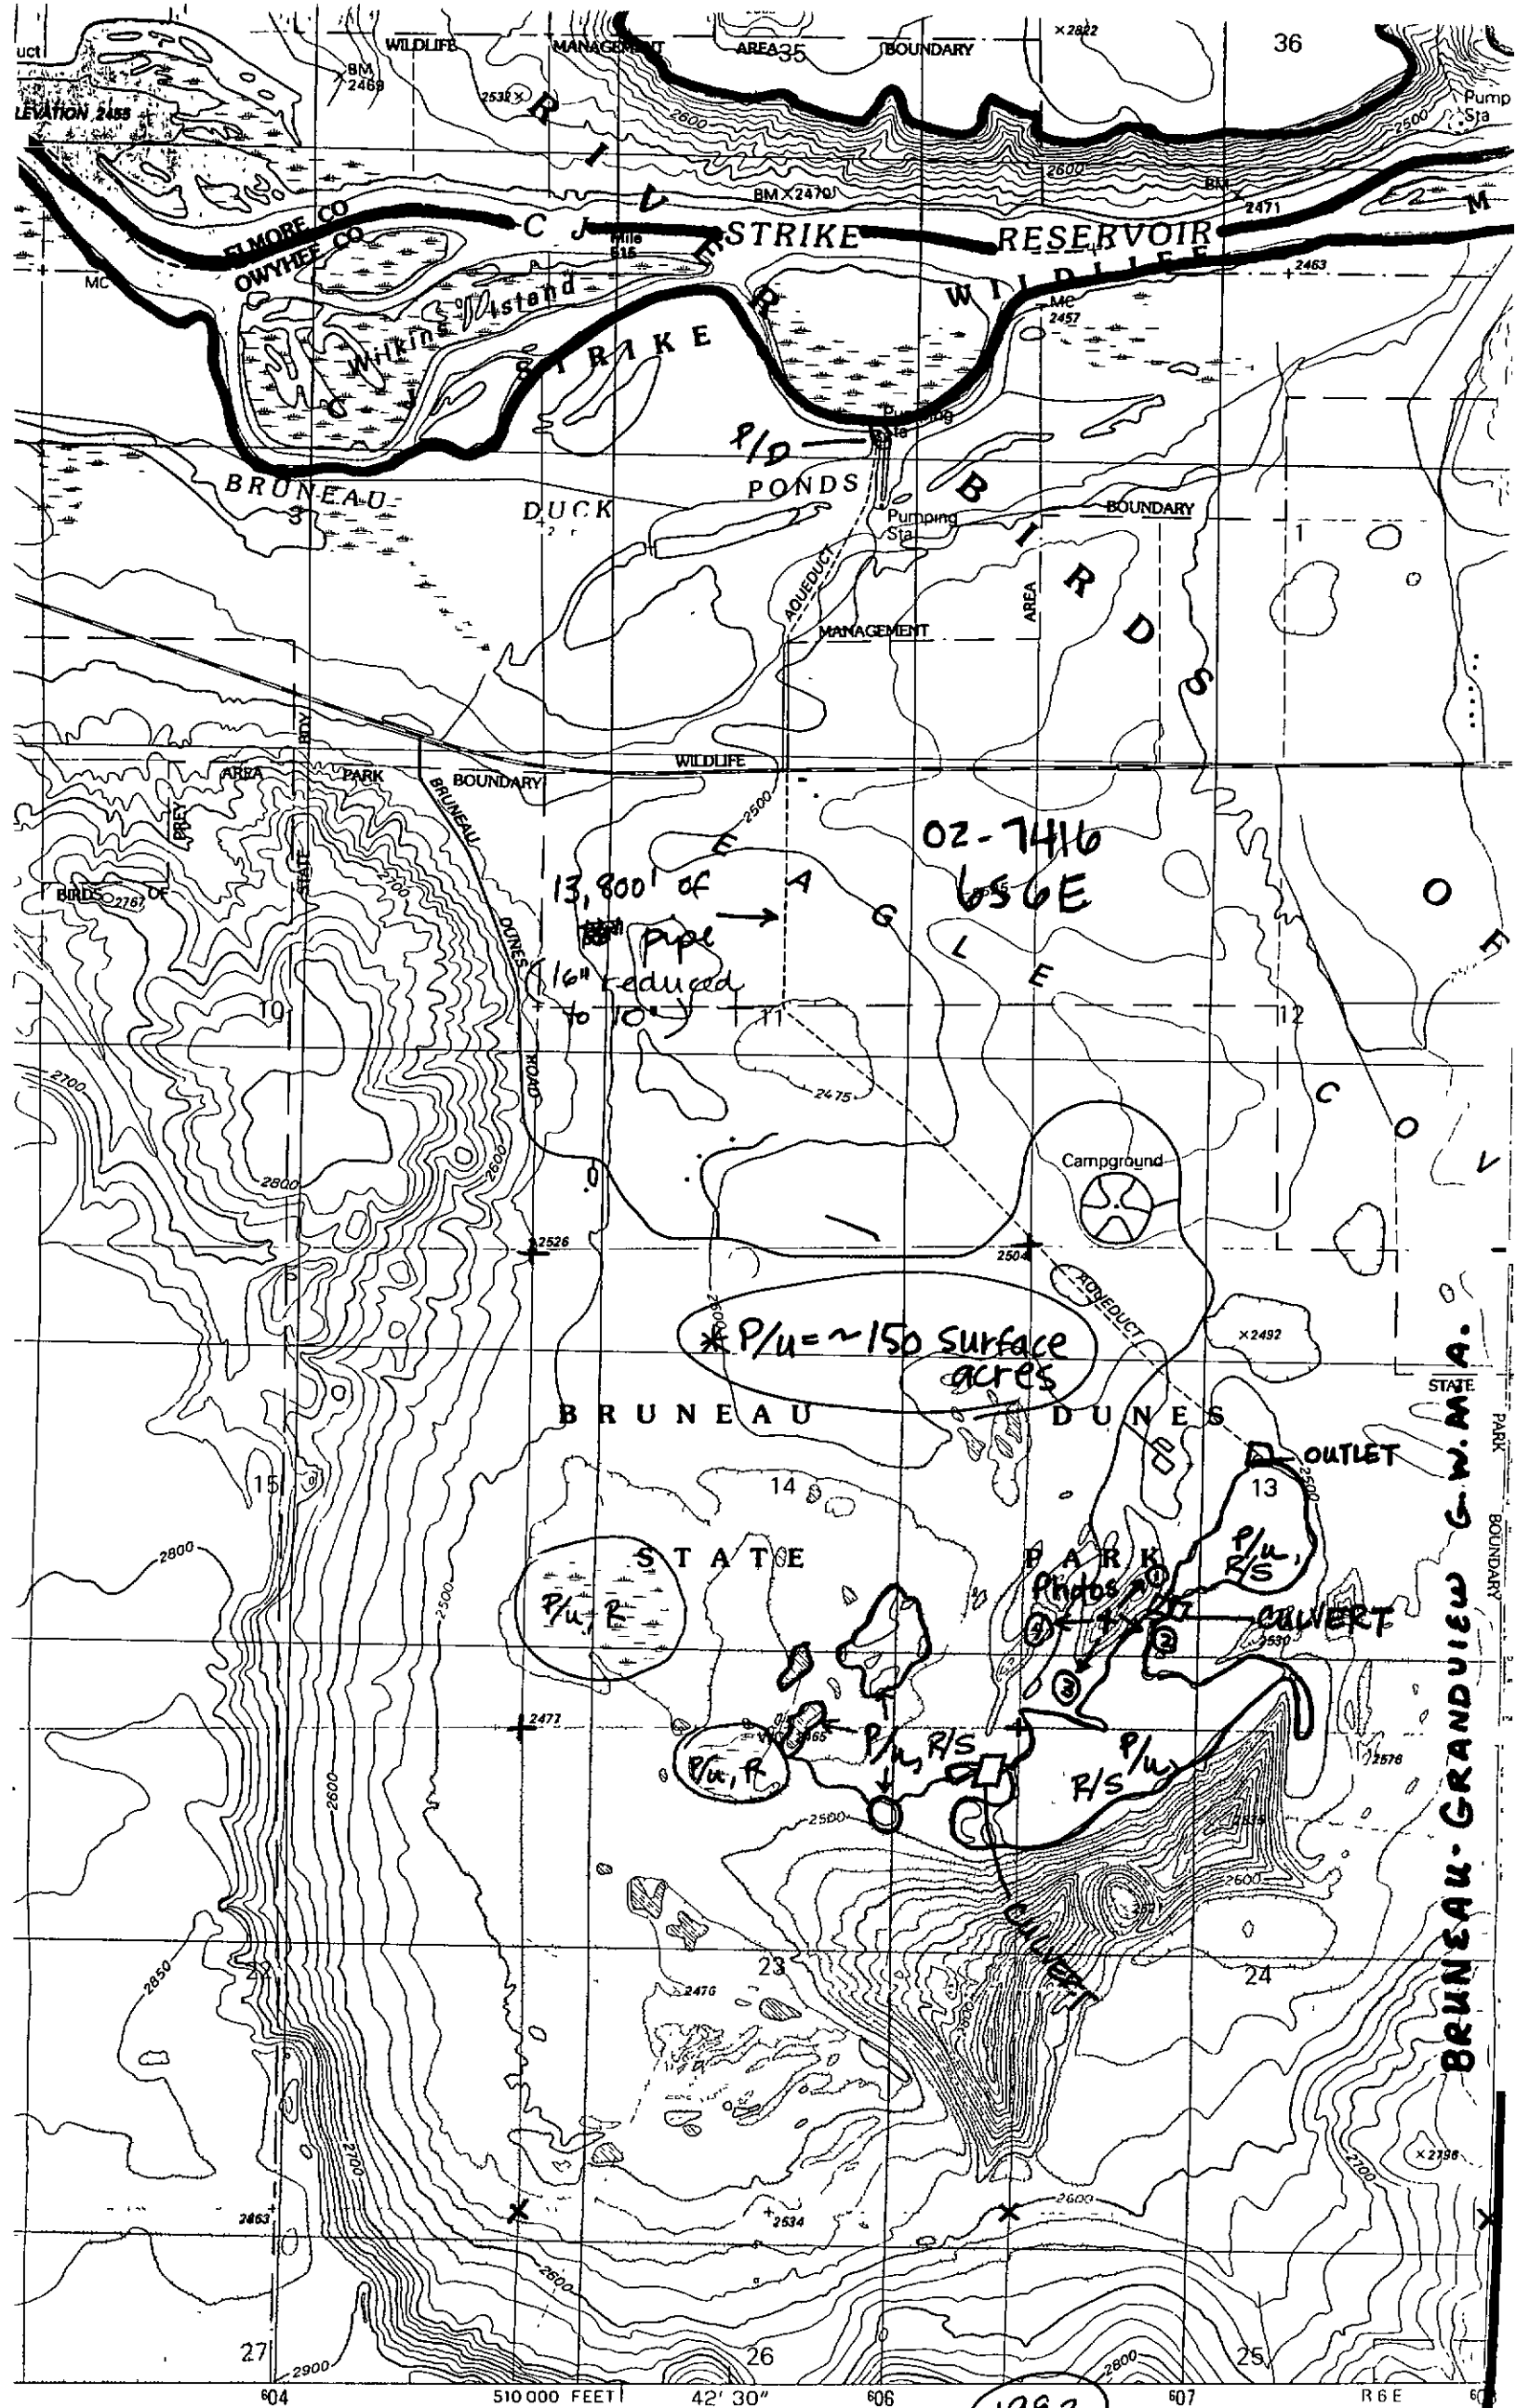

150 acre surface X 7.5 ft average depth = 1125 AF

← *or lose* Acreage was obtained through a comparison of the previous exam map, a 1972 USGS orthophotoquad and a 1992 USGS topo. There is no substantial difference in total wetted area among the three maps. The park manager confirmed the average depth of the pools.

This permit was developed and is used for "topping off" the Bruneau Dunes Lakes during the winter months. With the given surface area, 300 AFA storage volume as permitted provides a pool elevation increase of approximately 2 feet over fall base pools, which does not seem unreasonable based on my conversation with Mr. Whitworth. The whole of the diverted volume will be attached to the live flow components, with the difference of the two presumed to be that quantity lost to evaporation or used to recharge the surrounding strata.

SYSTEM DESCRIPTION:

The system has no diversion but the flow is from the source to the pump which is a 1/2 inch diameter. The pump is located in the middle of the system and the flow is from the pump to the source.

REMARKS:

As per the permit, I cannot determine the P.D. of the system. The available water is 14.5 GCS. The system is located in the middle of the system and the flow is from the pump to the source.
