The rate per acre calculations are based upon a 300 foot run at a 2% slope. An 8 hour set time was also used. Individual graded border evaluations, soil characteristics work sheets, and peak irrigation diversion requirement work sheets have been created and archived separately for each soil type.

Where actual rotation is shorter than the optimal rotation, optimal rotation is the criteria to be used for the recommendation analysis and, therefore, the rotation percentage adjustment is not necessary. The rate becomes the acres per soil type times the rate per acre from the above chart.

<<<< East

Photo taken from a knob overlooking lots 32 and 32. Photo looking nearly direct south.

Lot 31 is in the background. The north boundary runs east/west from the dirt road, through the green area along the ditch and to the fenced patch marked with an X. The ditch bisects the east 1/3 of the property, and it is possible that irrigation occurred between the ditch and the gray dry area in the center of the picture. Said gray dry area is higher than the surrounding land.
