

5. The water source for the farmstead utilizing this water was originally two springs tied together with a pipeline running down to the buildings. It was developed in the early 1900's. In the late 1980's this system was destroyed by the Idaho State Department of Highways, when they relocated Highway 95. The contractor for the Highway Department developed a new collection system adjacent to the new highway, which dumped the water into a cistern tied into a new pipeline carrying the water down to the farmstead. The collection system plugged up in 1999 necessitating the drilling of a well for the establishment of a permanent water source. The well is 427 feet deep and is located adjacent to the buildings.
