**SYSTEM ANALYSIS FOR
71-02078**

KKC

EASTERN PORTION OF P/U

Warm creek is basically a series of braided channels through the upper portion of the irrigated place of use and those channels are essentially the delivery system. The eastern point of diversion is the first spot that the water is diverted from the main channel and although multiple locations along that channel or other branches are diversion locations they are not identified specifically as the diversion works is a portable plastic or canvas dam that is changed whenever needed. Water flows generally southwest from the road until it reaches a natural swale which I recognize as the southern and eventually western border of the recommended place of use. This ground is alternately needing irrigation and somewhat boggy. The boggy areas supply water to the general water supply for irrigation. I did not attempt to differentiate between the boggy areas and the irrigated ground as later in the irrigation season much of the boggy area dries up and requires irrigation to maintain the vegetation. The stream channel was dry at the exam date and no measurement was possible. The method of irrigation does not lend itself well to measurement as a portion of the water is diverted at many points along the various channels and does not flow in a ditch structure but is, rather, directly applied to the field. Most all water in Warm Creek can be diverted to the field and as the channel can carry water in excess of the required diversion rate calculated using the revised Hubble analysis that rate becomes the recommendation.

DIVERSION BY HOMESITE

The western point of diversion is at a hot spring that rises in or near Warm Creek. I considered this to be part of the Warm Creek water. One ditch runs west past the homesite and then swings northwest along the base of the hill and waters ground that lays between the hillside on the north and the Warm Creek channel on the south southwest. A second channel flows from the same spot and eventually goes under a large hot tub that is also diverted from the spring. Those channels were measured using a Swaffer meter. See measurement sheets attached to the report.

WESTERN PORTION OF PROPERTY (OBSIDIAN TOWNSITE)

Ground west of the recommended place of use does not appear to be irrigated. Although I did not walk out all the ground I did not

see any evidence of delivery works leading into the ground nor did I talk to anyone that had knowledge of irrigation occurring on that ground. Buildings at the original townsite of Obsidian are actually sinking into the ground as that area is now a seep area. In a discussion with Brent Snider who irrigated a portion of the property, he indicated that if irrigation was practiced in that area it was some time ago. He felt that the irrigation to the north of this property has helped create the boggy ground.

SALMON RIVER DIVERSION AND SOTHERN PORTION OF PROPERTY

The Blechmanns told me that the diversion from the Salmon River has not been used for many years. This system originally irrigated ground in the south end of the property flowing north to the swale that now forms the southern recommended border. The water could also go into the boggy ground west of the current recommended place of use. Brent indicated that he had never irrigated with Salmon Creek water and did not know when it had been used. He did indicate that he had seen water in this system from Lost Creek during years of high runoff.

The rate per acre calculations are based upon a 300 foot run at a 2% slope. An 8 hour set time was also used. Individual graded border evaluations, soil characteristics work sheets, and peak irrigation diversion requirement work sheets have been created and archived separately for each soil type.

Where actual rotation is shorter than the optimal rotation, optimal rotation is the criteria to be used for the recommendation analysis and, therefore, the rotation percentage adjustment is not necessary. The rate becomes the acres per soil type times the rate per acre from the above chart.
