no lateral contraction of water passing through the weir is possible.

Conditions for accuracy of measurement for this type of weir are identical with those of the contracted rectangular weir, except those relating to side contraction. In the suppressed weir the sides of the approach channel should be coincident with the sides of the weir, and should extend downstream beyond the crest to prevent lateral expansion of the nappe. A suppressed weir in a flume drop is illustrated in figure 5.

Special care must be taken with suppressed weirs to secure proper aeration beneath the overflowing sheet at the crest. This is usually accomplished by placing vents on both sides of the weir box under the nappe (fig. 3).

(c) *Standard Cipolletti (Trapezoidal) Weir*.—A standard Cipolletti weir is trapezoidal in shape (fig. 6). Its crest and sides, which are of thin plate, are placed far enough from the bottom and sides of the approach channel so that full contraction of the nappe occurs. The sides incline outwardly at a slope of 1 horizontal to 4 vertical.

The Cipolletti weir is a contracted weir, and should be installed accordingly. However, its discharge occurs essentially as though its end contractions were suppressed because the contractions are compensated by making the sides of the weir slope outward.

Figure 6.—Cipolletti weir in a permanent bulkhead discharging under free-flow conditions. 103-D-859.

All conditions for accuracy stated for the standard contracted rectangular weir apply to the Cipolletti weir. The height of the weir crest above the bottom of the approach channel should be at least twice the head over the crest, and the distances from the sides of the notch to the sides of the channel should also be at least twice the head. The weir should not be used for heads less than about 0.2 foot, nor for heads greater than one-third the crest length. A Cipolletti weir is illustrated in figure 7.

(d) *Standard 90° V-Notch Weir*.—The triangular or V-notch thin-plate weir is an accurate flow measuring device particularly suited for small flows. The V-notch usually used by the Bureau is the 90° V-notch shown in figure 2.

The crest of the standard 90° V-notch weir consists of a thin plate, the sides of the notch being inclined 45° from the vertical. This weir operates as a contracted weir and all conditions for accuracy stated for the standard contracted rectangular weir apply. The minimum distances of the sides of the weir from the channel banks should be at least twice the head on the weir, and should be measured from the intersection points of the maximum water surface with the edges of the

Figure 7.—Cipolletti weir with a well-type head-measuring station. PX-D-53011.

Photo of Ridenour weir from just downstream. POD off Rush Creek is about 100 yards upstream of this point.

Above photos are taken of Ridenour Weir from just upstream. Rod instream is for scale. Actual measurements are in file 67-4052D.
