

Mission stock watering and light irrigation Co-op

We the undersigned have developed and maintained since 1962, a local yard and stock watering system to serve no more than eight property owners in the north west portion of section 24 and 25, township 49 north, range 1 west, Kootenai County, State of Idaho. Our source of water is the Mission Slough.

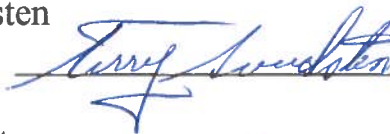

Water is drawn from the slough via a 5 hp. Pump to a storage tank, and then distributed to the various property owners through feeder lines to each property. Daily demand for water is no more than 20,000 gallons per day and is used no more than necessary depending on weather conditions.. Operating season extends from May until September 30th.

The irrigation system was developed by Ed Sverdsten and Terry Sverdsten in 1962. The need for the system was determined because of low output from private wells in the area. The Osborne Fault line in the area seals off underground water veins, and creates the need for additional water in excess of household usage.

Maintenance and power costs are shared on an annual basis by the members.
