Abstract—The purpose of this study was to determine the effect of a 10-week training program on the heart rate (HR) and heart rate reserve (HRR) of sedentary middle-aged men. The subjects were randomly assigned to a control group (CON) and an exercise group (EX). The EX group performed a 10-week training program consisting of 3 sessions per week of 30 min of aerobic exercise at 60% of their maximum heart rate. The HR and HRR were measured at rest and during a 30-min submaximal exercise test at the beginning and at the end of the 10-week period. The EX group showed a significant decrease in HR at rest and during exercise, and a significant increase in HRR at rest and during exercise, compared to the CON group. The results suggest that a 10-week training program can improve the cardiovascular fitness of sedentary middle-aged men.

I didn't GPS the point because the pump

from failure because it's to
costly to pump Marsh creek
