Dear Keith:

The soil on your property is classified as Hondoho Arbone gravelly silt loam. This soil is formed in alluvium derived from mixed sources.

The Hondoho soil is the dominant soil present here and below the 15 inch depth it is a composite of very gravelly loam and very cobbly loam.

Due to the above nature of this soil, it is very droughty and porous. Its water holding capacity is quite low when compared to the average silt loam soil in Bannock county. Specifically, its water holding capacity for a 60 inch profile varies from 4.8 to 6.6 inches of water, while the average silt loam varies from 11.4 to 12.6 inches of water.

Thus, the only way to have adequate irrigation water is to increase the amount of water needed by 40 to 50 per cent.

One other way to insure adequate irrigation water is to put it in a measuring devise at your property line.

Dear Keith:

As a follow-up to your question on the Hondoho gravelly silt loam, this soil has a lower water holding capacity than the average silt loam soil in Bannock County. As stated in our letter dated March 2, 1988, its water holding capacity is 4.8 to 6.6 inches, while the average silt loam is 11.4 to 12.6 inches of water.

Thus, if the State of Idaho, Department of Water Resources typical allocation per acre is .02 cfs per acre on average soils, then to have adequate water as stated above, an increase of 50% is needed.

The above information applies to all soils in your area labeled Honodaho gravelly silt loam.

Sincerely,

David L. Curtis
