Re: Change of Ownership Forms
John Lezamiz Family Limited Partnership

To Whom It May Concern:

Enclosed are two change of ownership forms submitted on behalf of the John Lezamiz Family Limited Partnership. The forms request a change of ownership for 8 water rights in the names of Alma, Connie, & Kelvin Jones to be changed to the name of the partnership. We have included the proof of ownership for the property and rights.

Since the rights have not been partially decreed and are still pending in the SRBA, filing fees are not required and have not been submitted with these ownership change forms. Please review the information included with this letter and contact our office if you have any questions or comments. Thank you and have a great day.

Sincerely,

Re: Lezamiz Property - Kelvin Jones Pump Measurement

Dear Ted:

As requested, Brockway Engineering measured the pump capacity for the well and booster pump arrangement servicing the property formerly owned by Kelvin Jones. The measurement was taken to determine the maximum system capacity of the deep well pump and associated booster pump connected to the distribution system. The distribution system supplies water to three pivots, hand lines, and wheel lines located on the former Kelvin Jones property, now owned by John Lezamiz.

The system is comprised of a deep well vertical turbine pump connected to a 375 Hp electric motor controlled with a variable frequency drive (VFD). The deep well pump discharges into a 14" diameter steel mainline. Splitting off from this mainline is a 12" diameter steel line connected to a 75 Hp booster pump & motor. The 12" discharge from this pump connects back to the distribution system to the irrigation systems. The booster pump is a constant speed pump and does not contain a VFD. The VFD on the large motor allows the motor to speed up and slow down to maintain pressure in the distribution system under varying demand.

For the purposes of our flow test, we utilized a strap on Fuji transit time flow meter. The flow meter utilizes ultrasonic signals between two transducers placed on the outside of the pipe to calculate the flow rate and velocity in the pipe. The meter was recently calibrated under direction from IDWR. For the purposes of our test, we utilized two sets of transducers to measure the flow rate in both the 14" mainline and 12" booster line. The summation of both of these measurements was used as the system capacity reported in this letter report.

During the flow measurement period, the system was operating with 2 large pivots, 1 small pivot, 1 wheel line, and 3 hand lines. During the flow test, the average flow rate (15 minute average) in the booster line was 2,633 gallons per minute (gpm). At the same time, the average flow rate (10 minute average) in the 14" main line was 13 gpm. Given the configuration of the pump and discharge piping, when the booster pump is operating, there is very

little flow in the main line. Based on this measurement, the maximum system capacity recorded at the time of our measurement was 2.646 gpm (5.90 cfs).

At this operating setting, the discharge pressure from the deep well pump was approximately 34 psi and the VFD was operating at its peak capacity. It is our opinion that this flow rate is at or very near the maximum system capacity. Changes in water level in the aquifer and minor changes to the system can impact the discharge from the well. However, the capacity presented in this letter report closely represents the actual system capacity in its current configuration.

Thank you for the opportunity to provide this flow measurement for your client. We have included a photo of the pump discharge piping for your records. We have labeled the pipes discussed in this report and shown the flow rates in the locations measured. Please contact our office if you have any questions or comments. Thank you and have a great day

Sincerely,

Jeffrey S. Rau, P.F.
