ESPA Impacts

Modeling Explanation

Modeling performed with Transfer Tool version 3.3. Mitigation is not required for Snake River reaches above Milner because of combination of Near Blackfoot to Neeley and Neeley to Minidoka reaches consistent with IDWR practice.

Further, mitigation is not required for Snake River reaches below Milner because under written IDWR policy, mitigation is not required (transient or steady state) when the river reach is impacted less than 10% of the total diversion volume. *Administrator's Memorandum, Transfer Processing No. 24, Transfer Processing Policies and Procedures*, December 21, 2009, at 13, 25:

Increased depletions greater than 10% in any reach are considered insignificant under either of the following conditions and will not require mitigation for the proposed transfer to be approvable:

- a. Increased depletions (transient to steady-state) to the reach are two acre-feet or less per trimester; or
- b. The reach, at steady-state conditions, will not be depleted by an amount greater than 10% of the total depletion to all reaches caused by the diversion under the proposed transfer.⁶

⁶ This exclusion from the mitigation requirement is consistent with the Department standard in various delivery calls against ground water users diverting water from the ESPA that establishes a minimum percentage of 10% below which ground water users are not required to mitigate or replace simulated depletions to the reach.

Id. at 13.

For applications that propose to move the point of diversion for a water right to divert and use ground water from one location to another within the ESPA, including any modeled tributary aquifers, mitigation is required for transfer approval when all of the following conditions occur: (a) the transfer would result in increased depletions (transient or steady state) greater than 10%, to any hydraulically-connected reach of the Snake River; (b) the increased depletion (transient or steady state) to the reach is greater than 2 acre-feet per trimester; and (c) the depletion, at steady-state conditions, to the reach is greater than 10% of the total depletion to all reaches resulting from the diversion under the proposed transfer. When greater increases in such depletions would
