Method of Determination: Statement of Completion

If Yes: From Use _____ To Use _____ Amount _____ CFS _____ AFA _____

H. NARRATIVE/REMARKS/COMMENTS

Proof of beneficial use on permit No. 92-11018 was due August 1, 2020. Idaho Department of Lands ("IDL") submitted statement of completion for water right permit 92-11018 on July 28, 2020. That statement was deemed incomplete and was returned to the permit holder. The permit subsequently lapsed on August 1, 2020, and a complete statement of completion was received on August 10, 2020. An order to reinstate the permit was issued by the Department on September 22, 2020 and the priority date was advanced to May 3, 2015 because of the late proof submittal.

The permit was for 0.20 cfs for fire protection and 0.20 cfs for industrial for a total diversion rate of 0.20 cfs. The application for permit stated that the industrial use was for forest practices and dust abatement. According to IDAPA 37.03.02.j.iv. no volume is required at licensing for the fire protection use, however a volume is still required for the industrial use. This was also stated in condition No. 6 on the permit "The right holder at time of submitting proof of beneficial use shall provide the department with annual volume for industrial use." Although sec. 7 of the statement of completion stated "Max annual volume=800 gal (Type 4 engine)" it was unclear if this was in reference to the fire protection or the industrial use for dust abatement. IDL was contacted and asked to supply information as to how much water was used for dust abatement in a given year during the development period. Response to this request was a table that included water right numbers, source stream, miles treated, acres treated, and total gallons used. The table also stated an assumption of 10 gallons per acre and 4 acres per mile of treatment. Total gallons associated with each right did not seem comparable with normal dust abatement practices and appeared quite low. When this question was posed IDL about these numbers, the response was that they were gallons associated with noxious weed treatment and not for dust abatement. It was also stated that no water was diverted from any of the PODs for dust abatement during the development period. The original table submitted did not include rights 92-11018 or 92-11025. When those were requested, a new, expanded table was submitted. This table included both these rights and also included a new column labeled gallons per year. The data in this column was the total gallons divided by 3, alluding to the fact that the total gallons was a total across a three year period. Since even the total across a 3 year period on all the right was much less than 0.1 AF, the minimum volume that can be placed on a right, there was no need to determine which of the 3 years had the highest volume, as it would never be above 0.1 AF.

Since weed spraying would still fit under the umbrella of industrial use, the industrial use was considered confirmed, however reference to dust abatement in conditions should be removed. Although dust abatement will not be covered under the water right, the practice is specifically listed as a use not requiring a water right under Idaho code §42-201 (3)(b), and therefore IDL may still divert water from the PODs listed on all the rights. This was also explained to the contact person at IDL.

The POD for the right was described on the permit application as in-stream fill sites and that the diversion rate will vary based on engine pumping capabilities. The data submitted for volume totals did not include any pump size information. Review of the National Wildfire Coordinating Group's *Water Handling Equipment Guide* (<https://www.fs.fed.us/t-d/pubs/pdf/03511206.pdf>), there are multiple portable pumps capable of pumping 0.2 cfs or 89 gpm, including the commonly used Mark 3 pump (specs page from the document attached) and basically all recommended mountable pumps that would be found on various fire engines and/or water tenders, are also capable of this rate or higher. Therefore the permitted rate of 0.2 cfs is recommended to remain for the license.

The POU for the permit was described as the same quarter quarter ("QQs") that the POD was located in. This was also described as such on the permit application. Although use will likely take place throughout a much larger region, both uses and the diversion rate fall within the exceptions of the need for a water right as outlined in Idaho code §42-201 (3) (a) & (b). As such, the POU description was used to secure the water right, however use outside the described POU will still be valid under §42-201 3.(a) & (b).

Conditions 26A, 106, and R19 on the permit should all be removed at licensing. Conditions X15, 077, and 004 should all be retained on the license. Condition No.5 on the permit "Industrial use is for forest practices and forest dust abatement" should be modified to state "Industrial use is for forest practices" because no dust abatement occurred during the development period.

Have conditions of permit approval been met? ☒ Yes ☐ No

I. RECOMMENDATIONS

1. Recommended Amounts

<u>BENEFICIAL USE</u>	<u>PERIOD OF USE</u>	<u>DIVERSION RATE</u>	<u>ANNUAL VOLUME</u>
FIRE PROTECTION	01/01 – 12/31	0.20 CFS	AF
INDUSTRIAL	01/01 – 12/31	0.20 CFS	0.1 AF
<u>Totals:</u>		0.20 CFS	0.1 AF

2. Recommended Amendments

Hello Scott,

Attached is the information for 11025 and 11018. It is on the same spreadsheet as the previous information we submitted but I highlighted the records for your convenience. Have a happy holidays.

Subject: RE: Fire Protection and Industrial Water Use Permits

Good morning Rick,

I have yet to see any water volume use information related to permit 92-11025, sourced from Merry Creek. In addition I have also now received permit 92-11018, sourced from South Fork Santa Creek, for licensing review. This one was

delayed a bit because the permit lapsed due to a late submittal of the proof of beneficial use, which required a reinstatement process for the permit. I will also require volume information for 92-11018 in order to complete the licensing process. Looking through Department records, it appears this is the last one of this suite of permits.

I would like to remind you of condition 8 on all of these permits which states "The right holder at time of submitting proof of beneficial use shall provide the department with annual volume for industrial use.", and as such volume information should have been provided along with the proof of beneficial use statement. I ask that you please respond within 7 days in order to facilitate timely processing of these water rights.

Thank you again,

Scott

Good morning Rick,

I just wanted to reach out again and see if you saw my last email (below). I have just about everything I need to finalize licensing of all these permits except for volume information on 92-11025 and any sort of confirmation that you guys have the capability to pump at the permitted rate of 0.2 cfs (90 gpm) i.e. you have pumps on trucks that are capable of that rate, even if that was not what was used for the weed spraying.

Thanks again!

Scott

Subject: RE: Fire Protection and Industrial Water Use Permits

A couple more questions Rick,

First, I just realized there was no information included on the spreadsheet for water right 92-11025, sourced from Merry Creek. Was this diversion point used at all during the development period?

Second, just to confirm the diversion rate of 0.2 cfs, what is the max pumping rate (in either cfs or gpm) for the largest pump that could be used for any of the engines for fire protections? And perhaps the horsepower of that pump as well.

Thanks again, this info should get me pretty close to done.

Scott

Subject: RE: Fire Protection and Industrial Water Use Permits

Scott. The use was not dust abatement. It was a chemical application to control roadside noxious weeds and brush.

We will perform this application again. We will typically apply once every 3-7 years depending on the presence of noxious weeds and brush impeding the roadways. These sites will likely be used again within the next 3 years. For the purposes of volume calculations, I think that saying we will repeat this application every 4 years will suffice.

We did not perform dust abatement during this time period, but it is possible we may need to perform it at some time in the future.

To: Rick Arcano <RArcano@idl.idaho.gov>

Subject: RE: Fire Protection and Industrial Water Use Permits

Good morning Rick,

I have some questions about the figures you shared with me. The number one question is that the application rate and subsequent totals seem very low to me. The spreadsheet states an assumption of 10 gallons per acre and 4 acres per mile. At 4 acres per mile, this would equate to an average road width of about 30 feet and a water application rate of 40 gallons per mile of road. That application rate seems extremely low. Typical rates we see for dust abatement here at the Department are on the order of thousands of gallons per mile, especially on roads that wide. I just want to be sure we are capturing the correct amounts as I develop recommendations for permanent water rights. I want to be absolutely certain I am not shortening you on the amount of water authorized for use under these water rights. Additionally, Are these applications taking place only once a year or do they happen multiple times? If they happen repetitively, I will need to know how many times a year this amount is applied at each site, as I need to calculate a volume for the entire year's worth of use and not just an individual application.

Thanks again.

Hello again Rick,

I'm just checking back in to see if there has been any progress in finding any usage data/information on the rights we discussed earlier? IN addition to the ones I inquired about before, I have also been handed permit 92-11027, which is basically the same as the rest and sourced from Little Carpenter Creek in Benewah county, basin 92.

I've pretty much got all of these ready to go, other than volume information, so the sooner I get that info the sooner we can get them licensed.

Thanks again, hopefully the fire season has subsided in your area.

Subject: Fire Protection and Industrial Water Use Permits

Hello Rick,

I'm writing in reference to water permits 92-11019, 11020, 11021, 11022, 11023, 11024, 11026, & 11030, held by the Idaho Department of Lands. All these permits are for fire protection and industrial use and the industrial use was stated as for dust abatement. As I work through review for licensing recommendation, I need to develop an annual volume for the industrial use on the rights. I see the statement of completion for all of these permits included the statement "Max annual volume=800 gal (Type 4 engine)." Is this associated with the abatement as part of the industrial use or is the 800 gallons associated with the fire protection use?

Basically what I am looking to get to is, how much water is used annually for dust abatement on each of these rights? If you had a truckload size and a maximum number of truckloads used in any of the years from August 2015 to July 2020, that would be a perfect way to determine this.

Thank you, and feel free to call me at 208-287-4915 if you have any questions.
