My only concern with this filing is a potential for insufficient flows in Fourth of July Creek in late summer. I advised applicants of this possibility. There appear to be two small existing diversions between the application POD and the confluence with the Salmon River that will be senior to any right developed. There should be sufficient flow for diversions under the permit into early summer, so my concern is not great enough to warrant any delay in processing.

WD Flag = NWD

Suggested W&S conditions 01H, 197 (or 115), 198. The diversion will require measurement once the area is included in a Water District. I question inclusion of a measuring device requirement prior to a measurement order being issued for the area.
