James

I had a good visit with John and Bryce Campbell last Tuesday. We identified two wells that we can use for monitoring and there is possibly a third well to the south on property owned by their uncle, Stan Campbell. I haven't had a chance to talk with him about that well, but will do so. It is supposed to be near the south extent of the irrigated ground, which would be ideal for watching the impacts of all of the newer wells.

Lin,

John Campbell's number is 670-5248. The monitoring well will likely end up on property owned by Bryce Campbell. His number is 670-5316.

We are conditioning Bryce Campbell's water rights to require him to make a well available for monitoring, so I think he should be helpful in designating a good well. I haven't spoken to Bryce directly, but John Campbell has been very nice and helpful in my conversations with him. They are expecting a call from you.

I am planning to be in the Juniper/Holbrook area during the last week of March. If that is soon enough, I'd be happy to visit with John while I'm there.

I would need to look at the area a little more to determine whether the Nelson wells would be useful. It may be that there is a topographic divide that doesn't translate into anything significant in the subsurface. I think the Utah report may be able to provide some insight. I had thought that a well between the Black Pine stock well and the border might be more useful in the future but I'm open to possibilities either way.

I just spoke with John Campbell. He is willing to make one of his stock or domestic wells available for monitoring. He mentioned an unused well on the property, but he's concerned that the well is too shallow and would be dry by the end of the season. I told him that we would set up a time for Lin to meet with him and evaluate which of his existing wells would be best, or if a new well would be needed.

I think we should see if Zeldon Nelson would be willing to make one of his wells available for monitoring too. His wells are located on the other side of that small divide and may provide a slightly different picture.

Hi James, I followed up with Lin Campbell after our meeting. He has looked into the prospective well near Juniper that the USGS had measured twice. That well is no longer accessible for water level measurements. If the Campbells have a well on their property near Juniper that is unused or very lightly used (i.e. a stockwater or domestic well) and it is accessible for measurement, Lin would like to add it to our water level network. He would be willing to visit the Campbells to check the accessibility of any wells that might be suitable.

Thanks,
Jennifer
