FIRE PROTECTION FLOW RATE REQUIREMENTS

FIRE PROTECTION ENGINEERING

November 20, 2015

Chief Trosky,

Please find attached a summary of the proposed fire-flows for the Idaho Youth Ranch Project and below the relevant code explanation. The minimum allowable fire-flow is 1000 gpm at 20 PSI per NFPA 1142 (2012). The acceptance of the final desired fire flow is regulated by the fire authority having jurisdiction (AHJ). We propose your acceptance of the 1000 gpm at 20 psi as this meets the minimum requirement and is attainable from the proposed well and pumping station system.

The procedure for determination of fire-flow is based on the International Fire Code (2012), appendix B, for building structures. Per B103.3 for rural areas which adequate and reliable water supplies do not exist the use of NFPA 1142 is an acceptable approach with the approval of the AHJ.

Per NFPA 1142, table 4.6.1, the minimum required delivery rate is 1000 gpm based on the size, use, and construction type of the proposed buildings. The calculated maximum available water capacity is 326,250 gallons (Arena) at the deliverable rate of 1000 gpm. At this time the proposed water supply and well system is anticipated to deliver this 1000 gallons for 5 hours or longer exceeding the minimum supply capacity requirement.

Please verify the acceptance of the use of NFPA 1142 for the determination of fire-flow for the new proposed Idaho Youth Ranch campus. Please feel free to call our fire engineer, Dan Kopp at 1-406-324-7385 or me if you have any questions.

Thank You,

Connie St. George, Architect

Subject: Idaho Youth Ranch Proposals

Dear Phil,

On behalf of the Idaho Youth Ranch Inc., this letter is in response to your letter dated September 10, 2015 requesting additional information to support applications 63-34107 and 63-34109 submitted July 10, 2015.

Included as **Attachment A** is a Notice of Change in Water Right Ownership for appurtenant water rights 63-9299 and 63-26025; included as **Attachment B** is justification for the flow rate proposed for fire protection; and below is additional information supporting the flow rate proposed for domestic use. Per your email dated September 14, 2015, the information requested for "large diversion projects" was deemed not necessary for these applications.

Domestic Use. The following table shows the results of a fixture analysis based on plumbing fixtures in all the proposed buildings used to determine peak water demand. As a result of the analysis, the proposed domestic flow rate of 0.20 cfs (90 gpm) was based on a peak demand of 70 gpm plus a 20% safety factor.
