I want to protest this application of permit No 63-33643, The area of this pond is in low water drainage for wet area of NWSE Sec 17 drain lines were buried many years ago across my land because of high water tables.

These drains come out into this drain. A few years back this held up the lines and caused alkali spots in my farm land.

The map that came in the information to me shows a dam was constructed on the west end of the pond, which has disturbed natural flow of the drain.

If they will remove the headgate on east end, Point of distribution and lower the water elevation of the pond 4 inches, we think this will lower the pressure on the field water table we can live with it.

By removing the Point of ~~distribution~~ headgate the natural drain flow will be returned.
