Eastern Region

2-13-14

Idaho Department of Water Resources.

As President of Soda Creek
11-B I feel responsible for
the protection of the water
users of 11-B. The application
of P-4 Production of 79037
raises concerns of the effect
on the Springs of SODA CREEK
in these drier seasons.

I feel that grouping the
Water Rights of 11-2102, 11-2107A
11-2107B, 11-2141 and 11-2144 plus
THE New Wells would cause problems.
The different divisions of the plant
may not know the water draw
of each well at a given point
in time, only that each well
may not exceed 12.85 CFS, causing
excess draw if one or more
wells are pumping at the same
time.

Receipt
#ED39549

The lack of information of the size of the new wells drilled or depth projected into the same aquifer as the Springs of SODA CREEK, plus the size of pumps put into service raise alarm as to harm the Springs of Soda Creek because of draw down to the aquifer. Time should be taken to study the intended effect.

Putting the Water Rights on wells under the same number presents problems in piping the system together and the distance apart of the wells. The new wells to the Silice pit are great distance from the old system and themselves.

Therefore I protest the application # 79037 of P-4 Productions

Brian Torgesen
President of Soda Creek II-B
