Dave,

Our Hydrology section completed their analysis for Hoot Nanney Farms. Although the boundary between the shallow and deep aquifer in the area is not well defined, they concluded that going beyond 200' to the next water bearing zone would likely impact the deeper aquifer. There is moderate water bearing potential in the range between 125' and 200'.

We're prepared to re-issue the permit, but I wanted to give you a chance to review and respond before we proceed.

Jeff
