Re: CFS, Wildlife Component, and Location of POD

It was determined that this should be called on-stream storage, since the ditch from the unnamed stream to the storage pond is now the natural channel. For this reason the Wildlife component will be dropped and the POD will be moved to the pond (an amendment will be required). There will be no diversion rate included on the license.

Since this is on-stream storage, the POD will be located at the southeast end of the pond, where the level of the pond is controlled by the buried infiltration gallery (there is a 4 ft precast manhole type A, with Eccentric cone located there).
