try out one way analysis. If reach depletions go up, it is a debit, if they go down, it is a credit. Sum all debits, only where mitigation is required (dark red), and all credits (light yellow). Mitigation is required for the full amount of summed values if greater than zero.

nsient state analysis represents mitigation requirements for the worst or maximum time step in the model run.

[illegible]

-valuation of transient state mitigation requirement is not comprehensive across all time steps. Instead this evaluation finds the maximum stream depletion following the start of the transfer and looks at depletion amounts from 1st time step. In many instances this depletion is greater than the depletion associated with the steady state condition or final time step. This evaluation is merely an indicator of whether transient depletions must be considered, not an indicator of all transient impacts.
