Carry out one way analysis. If reach depletions go up, it is a debit, if they go down, it is a credit. Sum all debits, only where mitigation is required (dark yellow), and all credits (light yellow). Mitigation is required for the full amount of the summed values if greater than zero.

Steady state analysis represents permanent mitigation requirements at future steady state (or last timestep from the ESPAM Transfer Tool model run).

Transient state analysis represents mitigation requirements for the worst or maximum time step in the model run.

Evaluation of transient state mitigation requirement is not comprehensive across all time steps. Instead this evaluation finds the maximum stream depletion following the start of the transfer and looks at depletion amounts from that time step. In many instances this depletion is greater than the depletion associated with the steady state condition or final time step. This evaluation is merely an indicator of whether transient depletions must be considered, not an indicator of all transient impacts.

Evaluation of Permanent Mitigation Efforts (non-use, acreage consolidation) in Addition to Off-Setting Transfer Benefits - Steady State Evaluation Only

PROPERTY OWNERSHIP AFFIDAVIT

I, Lance Funk agree to the proposed change in point of diversion and place of use as described in a transfer submitted to IDWR for water right 35-2824. I understand that Kip Hunter owns water right 35-2824 and that the transfer proposes to move 35-2824 to property that I currently own.

I agree to the point of diversion of water right 35-2824 being located at the existing well identified at Township 7 South Range 29 East Section 5 NWNE.

I agree to the 121.0 acre place of use of water right 35-2824 being located at Township 7 South Range 29 East Section 4 NWNW.

Yeah that was a little unclear. Hopefully this is better.

Transient State: 2 Part Test Caveat

Even when the transient 2 part test conditions are met, mitigation during the transient state is not required, if mitigation is not required at steady state (last time step), and steady state depletions are greater than at any time during the transient state.

Typical Scenario: Transient depletions would require mitigation, even though no mitigation is required in the steady state.

Caveat Scenario: Transient depletions would not require mitigation, b/c mitigation is not required at steady state and depletions at steady state are greater than at any previous time.

Mat,

Can you elaborate more on slide 7 concerning when transient state mitigation is not required when the mitigation requirements for steady state are met?
Thanks

Greg,

The slide show presentation I was referring to was last updated in June of this year. It approximately 15 meg is size so I can only make it available via the FTP (see instructions below). I have place the document in the main root directory of the FTP.

The file name is 'Mitigation_Analysis_6-7-11.pptx'.
