RE: Phone Conversation with Terry Gregory (764-2489) of Fish and Game RE: Volume

Today I spoke with Terry of Fish and Game to find out how the system is operated in order to quantify the annual volume under permits that authorize the live flow of water at Camas Prairie Centennial Marsh. He told me that he pumps water when the existing water starts to go down in order to fill brood ponds. He said typically he uses the wells for one month a year but worst case scenario may switch on the wells from May 1 to August 1. When the wells are switched on, the wells run at full capacity 24/7. He does not have any diversion records at this time but is within the newly formed water measurement district in the Upper Big and Little Wood River Basins and is working towards installing measuring devices on the wells.
