

MEMORANDUM

Date: January 20, 2012
To: Water Right File 79-7194
From: cpalmer
Re: Licensing memo

PD: The PD consists of a ground water that is pumped in a tunnel into a diversion system to the home. The spring was removed from the license since the water does not make contact with the surface before it is pumped. PD OVERLAP: The system found under this right is the same system that diverts 79-7137. The field examiner explains that this right will cover the groundwater for the domestic use while 79-7137 will cover any spring water, if any, that is used in the home. Since both rights divert from the same diversion works, F06 condition will be added but no limit is necessary since the field examiner found that the system can divert up to 0.10 cfs. Note that the field examiner states that 79-7146 diversion from the same PD as this right however; right 79-7146 is for stockwater from a spring that is located 400ft down gradient from the tunnel.

POU: The residence at 118 Gold Rush Lane in Lucille is covered by 4 water rights total as follows:

Right	Source	Rate	Volume
79-7137 ~83	spring	0.04	1.2 afa
79-7194 ~89	groundwater (tunnel)	0.04	1.2 (as recommended by FE)
79-7269 2000	groundwater (well)	0.04	1.2 afa (as recommended by FE)
79-14082 2003	groundwater (sump)	0.02	0.1 afa

All the rights are diverted from different sources and should all be limited to the standard rate and volume for a home.

The POU is located in the SWNW, not in the SENW as permitted. An amendment is necessary to update the POU.

BENEFICIAL USE: While the right holder has submitted rights for mining and commercial uses, he had only developed a standard domestic use under the rights.
