The existing diversion pipeline needs a lot of maintenance, so I want to install a hydraulic ram near the cabin to alleviate this problem. Jim,

I looked over this transfer approval & noted the following:

You have added Lot 2 to the place of use SENW, but not the new P/D in the SENW? Lot 2 was already identified on the original P/D in the SWNW. Could you check which is correct & carry it on both the P/D & POU if covers the SENW.

Condition X62 replaces AJ conditions N11 & N13 (see middle column bottom of review sheet). You only have to edit the use to stockwater or domestic. I removed 071.

Domestic use should also be described in the comments "Domestic use is for 1 home" can be combined with location description "located within Lot 27, Valley View Cabins Subdivision, also known as Parcel No. _____." We try to retain the detail such as Parcel & subdivision numbers & names.

Rt 71-7126 is an SRBA Decreed Rt & should have Condition T19 added on the Transfer approval even though C18 wasn't originally on the decree. (T09 for claims before recommendations & T19 after.)

See Attached Condition Report for my changes/recommendations.

Let me know when you have completed this one.

1. jstanton 12/10/2002 Comment/Analysis

Comment: This is a simple transfer to add a more-convenient pod that serves a summer cabin on USFS land. The applicant has been advised to obtain written permission for this transfer from the feds. Mr. Mead plans to add a storage tank to this system due to the low diversion rate of the hydraulic ram, but from what he told me this will still be within the decreed volume. No site visit is planned. Recommend approval.

2. jstanton 12/10/2002 Legal Notice Remarks

Comment: This transfer proposes to add a diversion point closer to the cabin, in addition to keeping the existing gravity diversion further upstream. Total water use will stay within the allowed limits. The property is located about 21 1/2 miles south and 3 1/4 miles east of Stanley between Pettit & Alturas Lakes.

Vertical Elevation in Feet with Delivery Pipe Friction Factored in

NOTE: The amount of water delivered by the Water Ram can be increased by maximizing the Fall or lengthening the stroke. Lengthening the stroke causes the Ram to take in more water (consequently wasting more), and should be adjusted according to the amount of water available. The range of intake capacity of each model and size of Rife Rams is listed in the Table entitled "Prices & Specifications of RIFE Rams".

EXAMPLE: A Rife Ram, using a vertical Fall of 12 feet, pumping to an Elevation of 50 feet, will deliver approx. 13.2% of the water used. For a Model 30SU Rife Ram, using 30 gallons per minute, this would be approximately 4 gallons per minute. One gallon per minute=60 gallons per hour, or 1440 gallons per day.

PREPARING TO INSTALL THE RIFE RAM

Drive Pipe

For trouble-free operation, we recommend that the Drive Pipe be galvanized steel. In some cases, people have successfully used well-anchored PVC plastic pipes. Every time the outside valve closes, the flow of water is suddenly stopped. This causes a pulse to ripple through the drive pipe creating a vibration, which can put tremendous stress on PVC piping. The pipe should be straight as possible without elbows, and the same pipe size as Intake end of the Ram. It should be watertight and rigidly anchored, with a Strainer at the source end to keep debris from entering the Ram. See Figure 5.

The Drive Pipe itself must be of the correct length. Use the following guidelines:

Vertical Fall	Length of Drive Pipe
3-15 Feet	6 times length of Vertical Fall
16-25 Feet	4 times length of Vertical Fall
26-50 Feet	3 time length of Vertical Fall

Whenever special conditions exist, please ask us for the correct length and diameter of Drive Pipe to assure maximum delivery.
