

CAREYWOOD CREEK CONFERENCE

June 9, 2009

Comments from Judy Adams

It does not matter whether the water comes from springs or creek or wells, etc.

It is all part of the same drainage system.

The usage amounts then affect the water table itself.

Certain types of usage have greater effects.

For example, a pond evaporates water at a high rate.

Sprinkler irrigation can easily lose 50% to evaporation that does not reach the ground.

The same ground that receives the irrigation water, evaporates more water to the air.

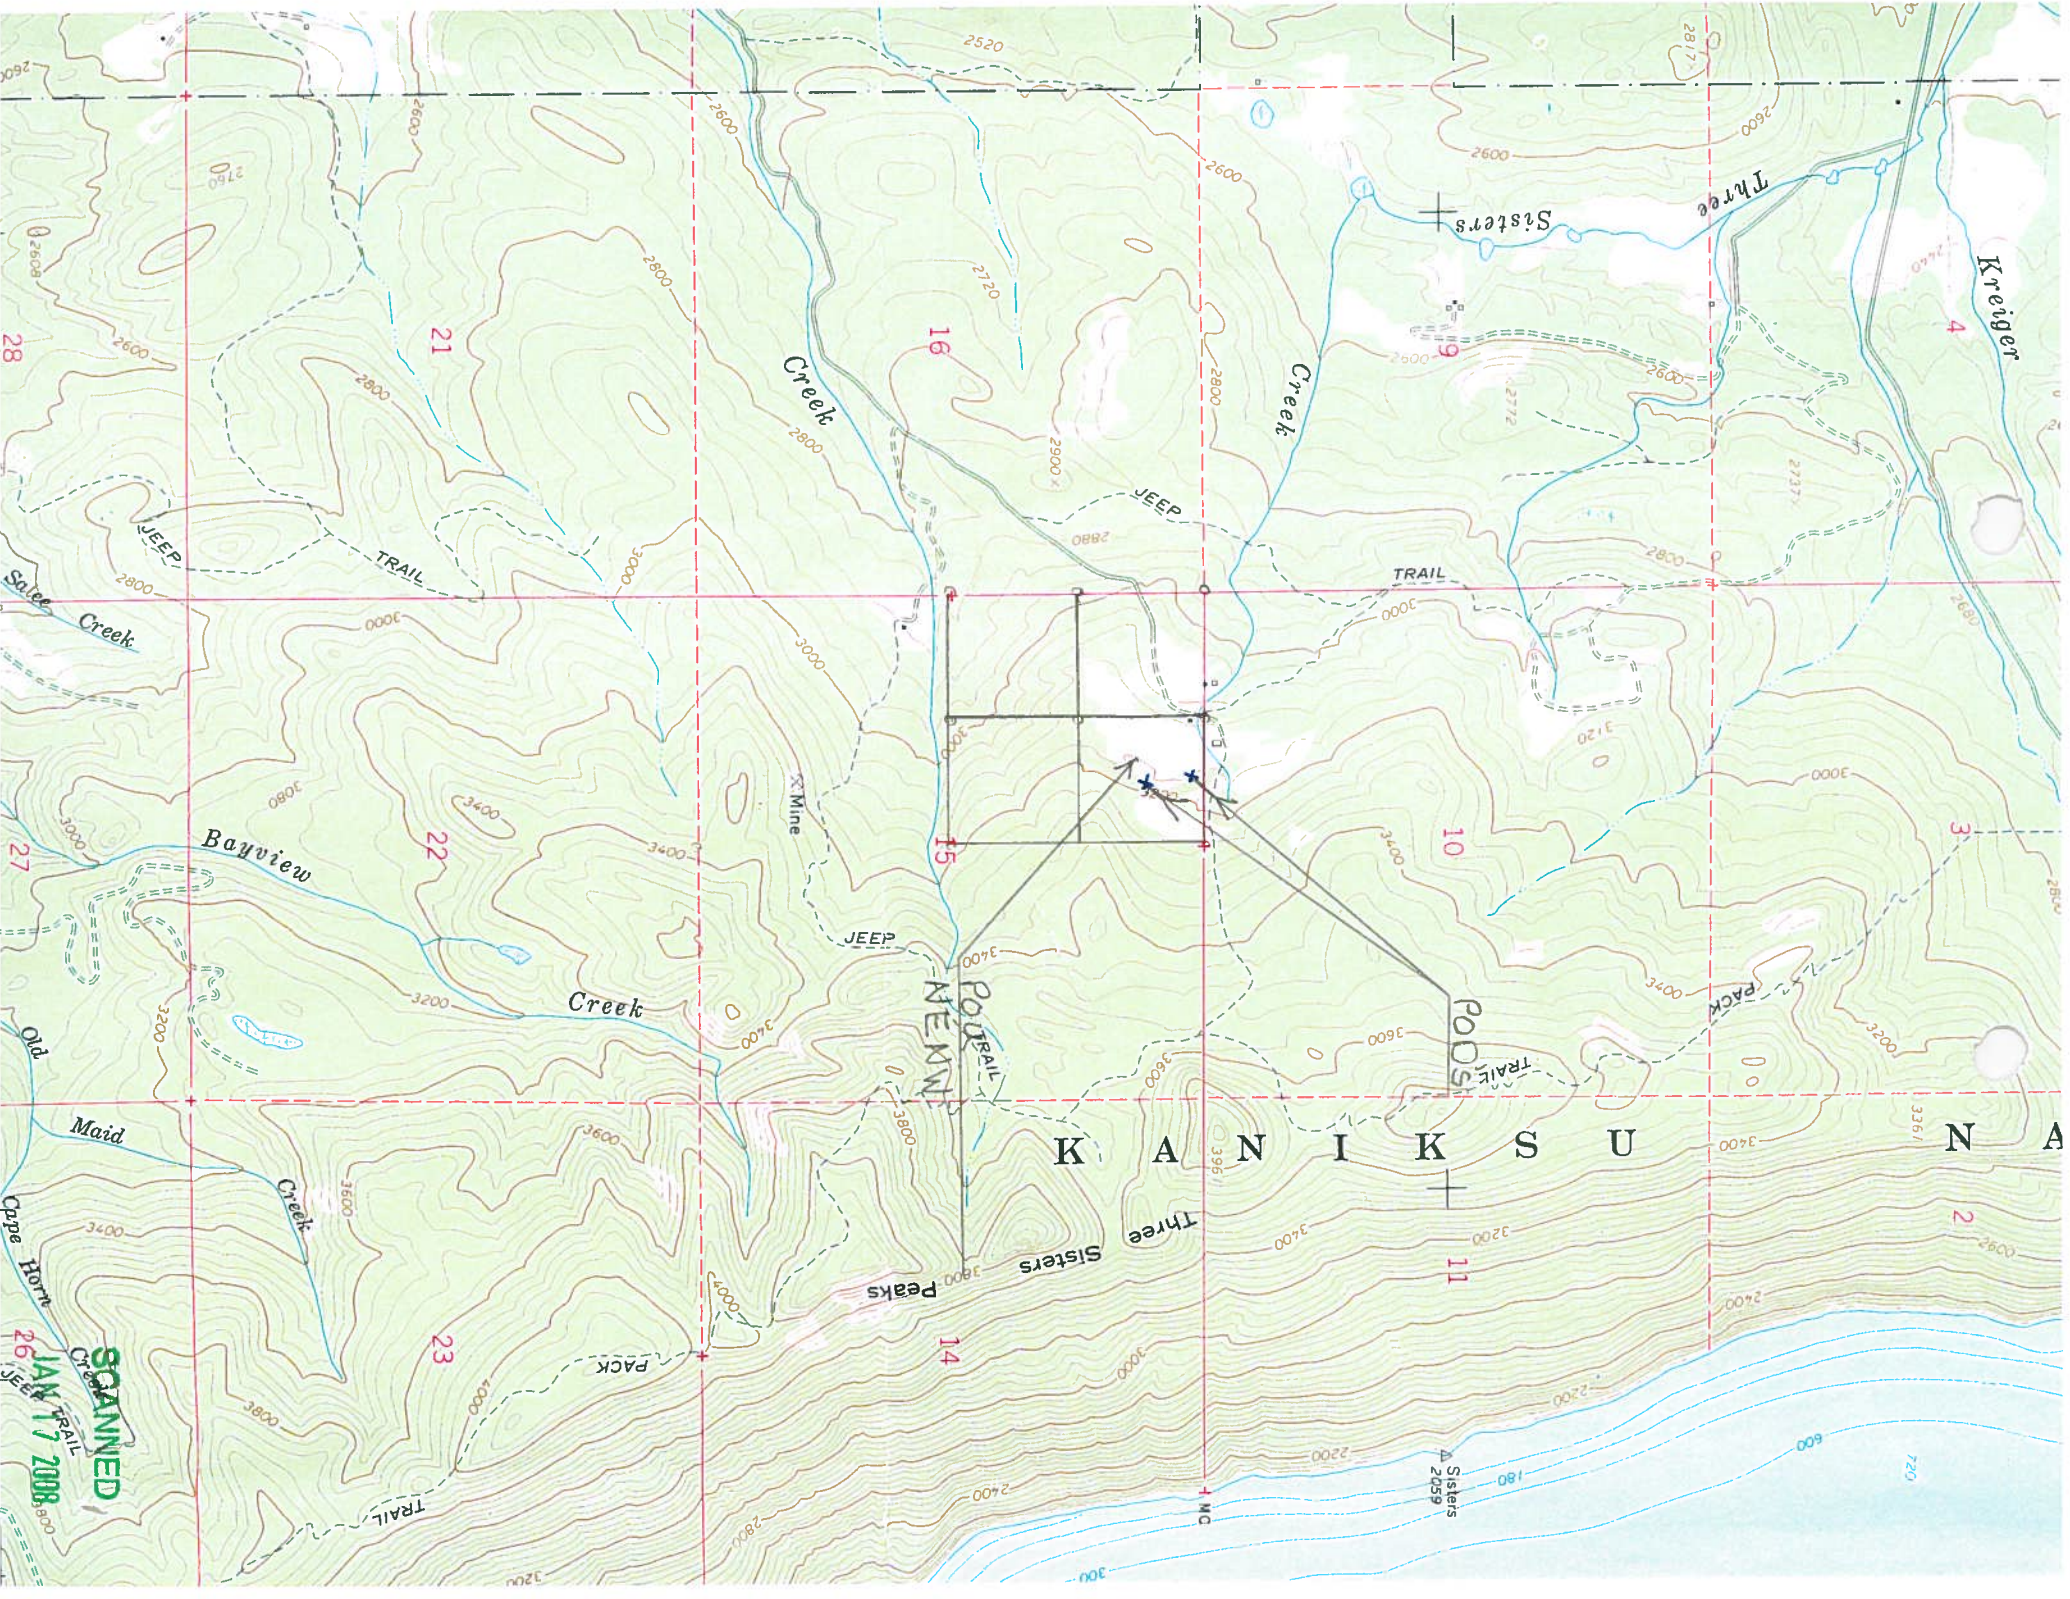

Ponds without approved liner systems lose significant quantities of water to the ground, therefore requiring more water to be added to the pond.

Your best decision is an informed decision. Therefore, I recommend IDWR obtain the services of an experienced Professional Hydrologist who is up to date on effects of water usage.

You might see if John Monk, Hydrologist in Sandpoint would be interested in helping out with this situation.
