Subject: Measurement of 37-22685.

Zack,

The 42-701 condition is sort of a placeholder and was put on there because of the Wood River Water Measurement District. However, as we reviewed, the Wood River Measurement District order allows an exception for uses less than 0.24 cfs to not measure and report so this right qualifies for the exception. I've not been able to check the injection well permit. Does it have a measurement condition?

When it comes to licensing the right a measurement of the flow rate would be valuable as well as a volume determination. A measuring device with totalizer would be helpful in this regard. Absent that, documentation of the heat exchange system as installed will be necessary to do an adequate licensing exam. Since you guys may be involved with doing the licensing exam you might suggest that a measuring device be incorporated into the system but at present it is not absolutely required by IDWR.
