Subject: Weir Installation

Sandy - This is status of measuring devices for Jussila -Bow Reservoir. Following the approval by Mr. Westra of our plan we contacted Valley County road department and got permission to install the upstream weir. We had the device fabricated and it was installed last Wednesday. The plan for the downstream weir had to be modified due to the limited access and size of the original device. The creek is two to three feet wide at the weir location and the pre-fab device from Idaho Tank and Culvert would have been a real challenge to transport and install. We are currently fabricating a device that will not require as much disruption to the stream banks through the excavation process. The new design will allow us to easily transport the pieces to the location and assemble them in place. Our intentions are to have the device in place by the end of next week.

Thank You for your patience and I will contact you the minute we are finished.
