Michele: Attached are photos of the collector sump for the SDTR water right. These photos were taken on October 6, 2011 by David Rosser, manager of the property. The sump collects water from the buried pipe collectors and includes the submersible pump which pumps the geothermal water to the facility. Note there are two ball valves (blue) on the supply lines which go to the flow meter and thence to the facilities. These valves allow adjustment of the discharge but are not lockable. The cover for the sump is a steel lid with a steel strap and padlock hasp as shown on the photos.

It is proposed that the sump supply valves and lockable lid, with a lock and key available to the Watermaster, suffices for the requirement on the proposed license of a 'controllable, lockable headgate'. The alternative is to dig up the supply pipe, valve, and flow meter and replace the valve with a lockable valve of some sort.

I am sending a copy of this e-mail and photos to Kevin Lakey, Watermaster and requesting that he respond to you relative to this request.

Thanks for your help.

Chuck
