DATE: June 29, 2011

RE: Licensing Review Memo

Timeline:

Application Received: July 8, 2004

Permit Issued: January 21, 2005

Proof of Beneficial Use: November 23, 2005

Field Examination: October 31, 2006

Point of Diversion: The two sources are part of the same system. The 8 hp pump is in the Payette River and is used as a back-up pump to the 2 hp pump in the unnamed stream. The capacity of both pumps can provide the permitted rate with plenty excess rate.

Overlap Analysis of PD: Right 65-22903 can also divert water from the pump in the river as a back-up source also. The two rights will not be limited to the capacity of the pump because it far exceeds the sum of both rights.

POU: The stockwater POU is apparently on the unnamed stream since the stock is in-stream use. The irrigated area was outlined by the field examiner.

Overlap Analysis of POU: There are no rights overlapping the POU for this right.

Volume and Diversion Rate: The diversion rate that the field examiner recommended is justified since the conditions limit the diversion rate of 0.02 cfs/acre. The stockwater covers 8 animals and should be limited to the amount found within the field examiners handbook. For 8 cattle, in-stream, the diversion rate is 0.01 cfs and 0.1 afa.

Amendment?: None needed.

Note that the 8hp portable pump that the right holder of 65-22903 uses as well is moved from one side of the river to the other depending on who is using the pump. This was clear in the field exam because of where the field examiner placed the PD. No overlapping conditions apply.
