

MEMORANDUM

Date: January 13, 2011
To: Water Right File 74-15436
From: cpadilla
Re: Licensing Memo

This license does not need a stockwater/wildlife from storage component because the animals are drinking directly from the reservoir. The spring that feeds into the reservoir contains a manmade diversion structure. Therefore, the field examiner recommended the addition of a diversion to storage component. It seems that this was the way the right was intended since condition of approval #7 provides for the measuring of water entering the reservoir when notified.

This right was permitted with watermaster conditions. Since the spring is tributary to sinks, typically the department wouldn't consider this to be in watermaster jurisdiction. The watermaster conditions will carry to license since this is how it was permitted.
