

PRE HEARING CONFERENCE NOTES

Transfer #76180—WR #57-2195

From: J. Westra

Date: 07/09/10

Participants: see roster

-The conference commenced with the review of the conference purpose, IDWR evaluation criteria for transfers, and handouts—maps etc.

-The Colletts outlined the intent of the transfer and the mechanics of their irrigation system. The current well is approx. 110 ft. deep with a 30 hp pump. The Colletts do not have 3 phase power on their ranch, so they are very limited on pump size. Ground water is pumped into 2 ponds where creek water is also comingled when available. Water from the ponds is then pressurized by another pump for wheelines. At present, they are not able to pump their water right flow rate. They propose splitting the flow rate between 2 wells, reducing flow at the existing well. The new proposed well depth will be approx. 150 ft. in depth.

-The Kings had questions regarding an 80 ac tract and how it related to the place of use acreage on the water right (57-2195). They also expressed concerns about injury to their existing domestic/irrigation groundwater wells and wanted to gain information on the proposal.

-Following an exchange and discussion, the Kings felt they were fine with the transfer, and withdrew their protest. *These are all good folks to work with!*

-Follow-up

There are 3 P/D's locations listed on the application, need to condition so that only 1 well is constructed.
