Blake,

I apologize it took so long to get this information to you. Attached is a diagram drawn by the client of his irrigation system.

As described by the client:

All water flows west to east with the exception of the pipe from the southern well to the retention pond where water flows south to north. The system is largely designed to use gravity as the elevation drops from west to east on the ranch.

The two pivots are obviously marked with the circles in sections 8 and 4. The broad area in section 5 contains two wheel lines and numerous hand lines as needed. Using Gibbs road as the dividing line in this portion, the north fields are generally handled by a wheel line as are most of the field south of Gibbs road and west of Oxford Rd. This is the field we use hand lines for "clean up" work as needed. The field east of Oxford Rd is used for grazing.

Kristin

Kristen:

Will you send us a diagram on the diversion works and how water is delivered through the irrigation system?

Thanks,
Blake
