Description of Work Completed and Request for Extension

The Richfield Well was drilled and installed in the spring of 2004. This included the installation of a Variable Frequency Drive to control the 500hp well motor. The system required a small structure for protection from the elements and from temperature fluctuations. Idaho power required a harmonic filter on the system. The cost breakdown for well install is found on the attached sheet labeled *"Richfield Irrigation Well 2004"*. The well was ran the first time for irrigation purposes July 12, 2004. This water helped to irrigate the 456 acre farm site that Glanbia has developed for the use of land application of process wastewater from its whey processing plant in Richfield, ID.

The system has been put into place to irrigate the majority of this farm site. We are still working on the development of the site in order to irrigate the remaining acres. Glanbia has shown diligence in developing the site, but would ask for an extension to complete all irrigation systems.
