

MEMORANDUM

Date: November 07, 2008
To: Water Right File 37-8564
From: nvandyke
Re: field narrative

Stockwater system consists of a pipe intercepting a spring at the head of a gulch beginning above the applicants property. Pipe acts to collect and focus spring so that a very small brook can run in the bottom of the gulch. Gulch intercepts applicants Northern property line and then extends about a mile before flattening out to a meadow that extends to the opposite Southern end of the property line (Glendale Rd). A small trough has been placed just below Northern property line in the small creek bed.

Permit as approved placed the point of diversion where the gulch intercepts the applicants property line. Point where pipe intercepts spring is on BLM property where gulch begins. The point of diversion was going to be recommended where the pipe intercepts the spring on BLM property with conditioning granting no right of way or easement. A licensing amendment was sent to the applicant with this recommendation. Before a signed amendment was returned I was advised this recommendation is in error. Further review recommends the permit should be licensed as an instream stock water right. I am recommending the license authorize an instream reach extending from where gulch meets with applicants property to where stream disappears underground at the meadow.
