Scott,

I'll take a look at what we have on file for the Little Wood River Ranch I project to find out if it has anything useful. If not, IDWR may have to propose something to you and the applicant. The NRCS surface water supply index may be one alternative for predicting whether flows will fall below "average".

Subject: Little Wood River Ranch II Hydro Project

Shelley,

I have gone through our files on Arkoosh's proposed project and they did not bring me any closer to figuring out what the meaning of "average" is in the case of the bypass flow regime. The consultant simply piggybacked on the existing bypass flow regime for the Little Wood River Ranch I Project that were established back in 1985. I cannot recall if the existing project has continuous flow recording equipment or not, but it would be nice to look at long term means and frequency of attaining the various flows.

Where do we go from here?

Scott
