SYSTEM DESCRIPTION:
Groundwater is diverted from an 825' deep well, 6" casing,
by a 3HP Shrike submersed pump motor, eff. .70, operating
OPSD = 40. Lift = 700'. Powered by Onan Electric generator.
15KW model 15-01G-4XR/11964. All Groundwater is
pumped into 18,000 gal storage tank. Stored water flows from
the tank via the force of gravity to a stockwater truck
REMARKS filling station and 1 wildlife watering trough
System shown & described by Dick Powell
(CRG) maintenance personnel. BHM.

Examiner's Signature Anthony R. Kozlowski Date Oct 17, 1978
Checked by Rooney Parker Date 10/25/78
Approved by Date

Q Calculation

Rate of diversion of groundwater into 18,000 gal storage tank.

$$Q = \frac{(3HP)(.70 \text{ eff. of pump motor})(8.814)}{(700 \text{ ft}) + (40 \text{ psi})(2.31)}$$

$$Q = .02 \text{ cfs (theoretical)}$$

At a diversion rate to storage of .02 cfs the groundwater system will replace 12,925.5 gallons of water in the storage tank each day. (theoretically)

Maximum consumptive stockwater demand occurs during the first grazing season when 1608 hd of range cattle can consume water at a rate of .35 cfs based on a 2 hr/day diversion and 12 gal/hd/day consumption.

If the daily theoretical availability of storage water in the tank is $12,925.5 / 18,000 (\text{cap.})$,

then, at a rate of consumption of .24 cfs (2 hr/day diversion), 12,925.5 gallons of water would be displaced from the tank in one day of max stockwater use.

Therefore, .24 cfs represents a max. rate of consumption of water without depleting the daily volume of water available in the system.

Finally, I recommend only .21 cfs of water be licensed on this permit as this represents the maximum amt. of water filed on, and is also within the limits of the system.
