I agree with the question which MS. Glicksman has asked.

I would like to further ask about livestock and IDWR definition of livestock. I have correspondence with Mr. Keen asking about livestock but I do not feel that I got an answer. What is considered household stock?

A document called Water Permit Report dated 5/19/2004 for water right 75-7589, Conditions of Approval, item 3.021 states "Use of water for domestic purpose under this right shall be limited to in-house use and watering of household stock".

Mr Keens e-mail to me dated 10/4/05 in reference to the same quote above stated that; Apparently the reference to household stock in IDWR'S computer database was an error. The order approving the permit actually says, "Use of water shall be limited to in-house use only."

I bring this up because one of the water board members is reported to be watering at least 12 head of horses.

According to IDWR definition for watering livestock is 12 gallons per day for 365 days equals some 52,000 gallons per year. This seems like alot water being used for other purpose than "in-house use only".

Additionally I have asked IDWR how the number of 64 homes was obtained. I know from personal experience that asking home owners this question I get different answers. I have never had a response to this question.

How did IDWR come up with the number of homes?

Thank you for your time.

Gary Mulkey
