RE: Water Right Permit No. 37-7854

Dear Ms Walker:

We received your letter of January 24, 2005 and are protesting the action to remove this water right permit on two points.

The first point is the time between the application for the water right in 1985 and the examination in 2000. In the time between the application and the examination this area had been through a drought condition for seven of the last ten years. We had seen a drop in the flow out of the Indian Creek Spring source for this water right. We do not feel this leads to a decreased need from the 5 cfs requested in the original application.

The second point relates to the use of this water right. It is a non-consumptive right, using the water from our three municipal water rights out of Indian Creek Spring; 37-296, 37-717 & 37-1216; for power generation with no loss of water. There is no difference in water use between generating power with this right versus sending it directly into the Indian Creek Storage Tank.

We have checked our flow meters at each site and show a difference of approximately 70 gpm between the spring and the tank. We are investigating for a leak along the three mile pipeline.

As a final note I find no difference between the location requested for this water right permit in 1985 and where we are located. I have included the legal description of the cogeneration site for your review.

In conclusion, we feel that the water permit right is appropriate at 5 cfs. The Indian Creek Spring has produced in excess of 5 cfs in the past and, with a couple above average snow seasons, we feel it will produce that in the future.

Please let me know if you have any questions.
