Subject: Searle Mitigation Plan

Chuck - One minor thing. Based on a cfs-to-daily-volume conversion factor of 1.9835 & a 246-day irrigation (3-15 to 11-15), the smaller Searle right would have 507.5 afa at the 1.04 cfs flow rate. This is slightly more than you used in your revised plan; my error, as I think I said this was 245 days instead of 246. I plan to recommend the higher volumes, as this is to your clients' advantage. Probably nobody will care, I just want to be fair about it. Sorry.
