 from storage, this permit makes sense. Assume intent of permit was
 to store & use 2 ac. plus additional fills (live flow). Total
 volume is live flow volume plus storage volume (26.8 +

All of these permits exceed .20 cfs and normally would require on-site field exams to verify the rate of flow developed. However, these permits are for runoff collected in pit-type reservoirs. No ditches, pipelines, or other conveyances are involved. On-site visits to these remote places would not clarify rates of flow.

Based on a discussion with the Regional Manager, 0.10 cfs is recommended in each case for lack of better data. This will provide significant flows exceeding the typical small flows found with most stockwater rights. If the BLM found the rates unacceptable, additional data could be provided by BLM to attempt to justify higher rates.
