SUBJECT: Licensing Exam 45-07588, Southwest Irrigation District

I have reviewed this exam per our recent discussions, and have concluded that the recommended flow rate is correct. The two measuring points are close to the points of diversion, and are the same points where irrigation diversions are measured during the season. They can divert higher flows for irrigation, but apparently the injection system cannot take the higher amounts. At any rate, it should not be necessary to add additional amounts to make up for ditch losses.
