Dear Mrs. Loos:

On May 29, 1968, the Boise District Manager issued an "Initial Decision" approving your desert land petition I-1336.

According to your plan of development, water for irrigation is to be obtained from a well to be drilled. You must submit evidence of your right to appropriate and use the water. The evidence should consist of a copy of a State water permit approved by the State Reclamation Engineer. Attached is an extra copy of this letter. The copy should be submitted to the State Department of Reclamation at the time you apply for a permit. Unless they have knowledge that the land of the desert land application has been classified as suitable for entry, they may decline to issue the water permit. You should make arrangements with the State Reclamation Engineer to have a copy of the permit sent to this office.

We would appreciate receiving a copy of the permit as soon as possible. Also, please advise us when you apply for the permit.

MEMORANDUM

TO: Gary

FROM: Jim

DATE: March 19, 1987

RE: 2 Applications for Transfer & 1 Application for Permit Filed
by Annabelle Erwin

Overview

In 1984, Annabelle Erwin filed an Application for Permit to use groundwater for fish propagation, No. 51-7277. However, since the proposed use is within the GrandView-Bruneau Groundwater Water Management Area, the application was not processed pending outcome of studies to determine available groundwater resource.

Recently, with the assistance of Dave Tuthill, two applications for transfer were prepared which would adjust the use of water of existing rights from the same point of diversion so that the diversion of water for fish propagation would not result in an increase of volume withdrawn from the groundwater aquifer.

One transfer application proposes to change the nature of use of five water rights to allow water diversion during the non-irrigation season. The water diverted would be stored and released the following year for irrigation. The other transfer application reduces a water right to compensate for evaporation losses occurring from the stored water.

Issues

While the concept appears to be sound, information concerning actual irrigation under the existing water rights and actual rate of flow from the well(s) appear to conflict.

For example, the five water rights identified in Transfer No. 3294, according to the water right descriptions, irrigate a total of 919 acres with a total of 13.48 cfs. This is simply not accurate.

The actual capacity of the well appears never to have been greater than 7.7 cfs and information supplied by Mr. Erwin shows recent flows ranging between 5.24 cfs and 6.8 cfs. Mr. Erwin also provided information stating that he has irrigated 744 acres rather than 919 acres. It is not clear if 919 acres were ever irrigated. The water right licenses were originally prepared without taking the capacity limitations into account.

Also, there may be a problem of accounting for storage evaporation losses from different wells than the well proposed for fish propagation.

RECEIVED

JUL 06 1987

The Department's experience in the Banbury Hot Springs Area has shown wells located in close proximity to each other are not necessarily connected to the same aquifer.

Little information is known concerning the similarity of the wells identified on the two transfer applications other than the wells identified in Transfer No. 3293 are not artesian and wells proposed for fish propagation are.

Per conversation with Dave Tuthill, the main reason for using this water right is because it had land already set aside in the A.S.C.S. Conservation Reserve Program.

In conclusion, I am not certain that the Department has a clear picture of what lands have been actually irrigated by the wells identified in Transfer No. 3294. If the acres of irrigation have been reduced, as a minimum a listing of the acres irrigated should be identified on the transfer rather than as now proposed.

The conditions presently proposed on the transfer applications are generic in nature and do not attempt to modify the rights to reflect present rate of flow nor to limit right to actual acres irrigated.

The application for permit conditions appear okay with the exception of the item identified in my memo of 3/10/87.

Adjustments

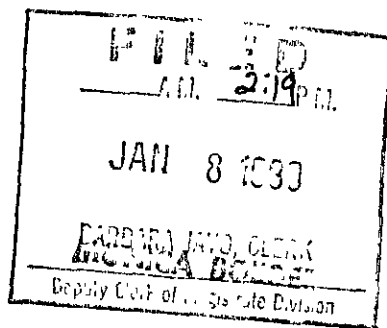

Per telecon with Mr. Erwin, he confirmed the suspicion that the water he filed the two transfer applications on were from different aquifer zones.

Based upon this information, adjustments were made to the conditions of approval on the transfer application containing the five rights on the artesian wells and a refund of the filing fee was given on the other transfer application.

See the transfer conditions of approval for methodology used for determining reservoir water evaporation.

SUBJECT: Evaporation Losses from Aquaculture Ponds in
the Grandview Area. Transfer in the name of
Annabelle Erwin.

The evaporation losses calculated by the consultant^(Dr. Roy Mink) seem quite reasonable. Basically, the estimates were derived by using pan evaporation data for the Parma Exp. Sta. weather site for the May through September period, estimating values for the other months of the year, and applying these amounts to the appropriate water surface areas during the year.

As a check on the two years of pan evaporation data used in the notes, May through September values for a seven year period were computed. The totals were virtually identical, with 40.4 inches for the shorter period and 41.6 inches for the seven year average. Evaporation was assumed to be zero for December and January, with values for the other months interpolated between the September and May observed values. Thus, the monthly and annual values were:

JAN	0.0 in.	JUL	8.9
FEB	1.8	AUG	9.0
MAR	3.5	SEP	6.6
APR	5.2	OCT	5.0
MAY	7.0	NOV	2.5
JUN	8.9	DEC	0.0
ANNUAL TOTAL			58.4

RECEIVED

JUL 06 1987

Assuming no evaporation during December and January seems a little odd, but may be acceptable for several reasons: First, the annual total seems reasonable. The 58.4 inches of annual evaporation computed by the consultant is very close to the

average annual reference or potential evapotranspiration of 57.4 inches for Grandview by Allen and Brockway, 1983. The reference ET does not include values for the winter months, but does cover a longer period of the year than only the growing season. Also the ratio of the off-season (Nov. - Apr.) evaporation to the growing season evaporation is about the same as that referenced in U.S. Weather Bureau Technical Paper No. 37. This tends to indicate that the off season total is about the right magnitude, just distributed differently. The second reason is that, based on observations of other ponds, winter evaporation losses seem very small. Calm wind conditions, which often occur during December and January allow a humid layer of air to remain over the ponds, thereby reducing water loss. In these conditions, diffusion is the dominant process of water movement from the pond to the atmosphere. Under windy conditions (typical of the growing season) convection, which is many times more effective than diffusion, will be the dominant process. A third reason why zero evaporation in December and January is believable is that any evaporation is small enough to be offset by precipitation during these months.

Normally, pan evaporation rates are reduced when applied to large bodies of water. The consultant's calculations used unadjusted pan rates. This method seems appropriate considering the small size of the ponds compared to a lake and the elevated temperature of the water. The 10 acre size pond will act more like an evaporation pan than a lake: Wind will advect considerable energy from surrounding arid areas to the ponds, with a resulting evaporation greater than that occurring from a large body of water. Warm water ponds will also evaporate at a faster rate than a natural lake because there is more energy available in the warm water.

Annual evaporation losses for the proposed project are as follows:

	<u>Evap. Rate</u>	<u>Water Area</u>	<u>Evap. Volume</u>
Nov	2.5 in	60 ac	12.5 ac-ft

Dear Mr. Erwin:

We acknowledge receipt of the affidavit submitted as proof of beneficial use for the above referenced permit. Enclosed is an Order of Reinstatement; please note that the priority has been advanced to August 7, 1968.

Before a license can be issued, a field examination must be made by a representative of the Department. We cannot tell just when this examination will be made but our examiner will try to contact you at the time he makes the examination so that you may show him the system.

We note that in reviewing your proof affidavit you do not indicate that you have installed a measuring device as required by the conditions of approval of your permit. This measuring device must be installed by the time our examiner makes the exam, or your water rights cannot be confirmed by the issuance of a license. We are enclosing a list of the types of measuring devices approved by this office.

If you have any questions concerning the field exam, please contact our Western District Office in Boise.

Netty Loos
Rt. B, Box 177
Bruneau, ID 83604

Dear Ms. Loos:

One of the conditions of approval of your water Permit No. 51-7022 (see last page of your approved permit) was that evidence of the extent of development be submitted as proof of application of water to beneficial use to this office on or before October 1, 1974. Enclosed is an affidavit form which must be used to submit the required proof of beneficial use.

If you have not fully completed your project, and you have not previously received an extension of time, you may request an extension of time provided the delay is for reasonable cause as indicated in Section 42-204, Idaho Code, amended. If you have been prevented from proceeding by a governmental agency or by litigation, more than one extension of time can be granted.

Either the beneficial use affidavit or a request for an extension of time must be received by this Department on or before the above mentioned date, otherwise the permit will lapse and be of no further force or effect.
