Dear Mr. Hamilton:

Mr. Kenneth Skow has requested that soils information for his farm be transmitted to you in reference to your letter of 8/22/74 concerning his water permit application #67-7214.

The name of the closest established soils series, the texture of the surface and the water capacity information available is listed below.

Emerson sandy loam surface (7 Ac.) - water holding capacity to about 28" in depth, ranges from 1.6"/ft. to 1.8"/ft. with an infiltration range of 2.0" to 6.0"/hr. Below 28" the water holding capacity ranges from 0.4" to 0.6"/ft. with an infiltration rate greater than 20"/hr.

Eaton fine sandy loam surface (3 Ac.) - similar to Emerson except that a weak pan is present at a depth varying from 30"-40".

Power fine sandy loam surface (10 Ac.) - this soil has a surface texture and water capacities similar to the previous soils, but may become a silt loam at a depth of about 9". The silt loam becomes more alkaline as depth increases, and a weak pan is formed at a depth ranging from 27" to 32". Water holding capacity of the silt loam ranges from about 2.3"/ft. to 2.5"/ft.; infiltration rates vary from 0.6" to 2.0"/hr. to the weak pan; which has a similar water holding capacity, but an infiltration rate of 0.2" to 0.6"/hr.
