Narrative in Support of Water Right Transfer
Southfield Dairy.
Jerome County

Water Rights 36-8760, 36-7157A
C.E. Brockway P.E. February 24, 2003

Southfield Dairy utilizes land in Sections 4 and 5 and 9 T8S R14E in Gooding County for irrigation and feed production for the dairy. (See attached map).

Ground water from a well irrigates some 326 acres with a sprinkler irrigation system as shown on the attached map. No water shares from Northside or Milner Gooding Canals are utilized on the lands.

Water right 36-7157A has been decreed in the SRBA for irrigation of 250 acres with a diversion rate of 3.3 cfs and annual volume of 1000 acre feet.

Water right 36-08760 has been decreed in the SRBA for irrigation of 326 acres with a diversion rate of 1.52 cfs and annual volume of 304 acre feet.

Water right 36-02907 has been decreed in the SRBA for irrigation of 40 acres with a diversion rate of 0.8 cfs and annual volume of 120 acre feet. This right is considered appurtenant to the place of use of 326 acres but is considered as mitigation for potential injury that might occur as a result of Transfer No. 3866. There no water is to be diverted under Right No 36-02907.

It is proposed to create a permissible place of use (PPU) for both water rights 36-7157A and 36-08760 within quarter sections described and shown on the attached aerial photo. A total of 442 acres have been identified as potentially irrigable within the PPU. However, based on the two water rights and overlap within the described places of use, a total of 326 acres can be irrigated in any one season. The listed number of acres within the place of use is shown on the attached map.

In order to improve the hydraulics of the irrigation delivery system, it is proposed to add a point of diversion (PD) to the system by constructing a new well in the NW1/4 SW1/4 NW ¼ Section 4 T8S R14E and connecting to the existing mainline from the existing well in the SW1/4 SE1/4 SW1/4 Section 4 T8S R14E. The main line runs along the section line between Sections 4 and 5.

Volume pumped from the existing well has been determined using the power consumption coefficient. The new well will be located at the other end of

T # 70489

the mainline and will be operated under a fixed mode with constant pumping pressure. It is therefore a suitable installation for utilization of the PCC for determination of pumped volume. The applicant is therefore requesting that flow meters not be required on these irrigation wells and the PCC method be utilized for pumped volume determination. Power consumption records will be made available and the PCC can be determined by the applicants consultant if desired.

An examination of the location of the existing well and proposed new well within the Eastern Snake Plain Aquifer ground water model shows that both wells are within cell 11,7. Therefore, under the new transfer guidelines, no hydrologic impact analysis is required.
