PARMA ID 83660ANN OBENDORF
26496 DEB LN
PARMA ID 83660

SOURCE: BOISE RIVER

TRIBUTARY: SNAKE RIVER

QUANTITY: 3.200 CFS

Whenever it becomes necessary for the watermaster to deliver this right the following condition shall apply. This right shall receive 100 percent of its decreed quantity until the natural flow of the waters of the Boise River shall decrease so that all rights containing this condition cannot receive 100 percent of their decreed quantities, at which time this right and the other rights containing this condition shall first be cut to 75 percent of their decreed quantities, as the natural flow of the river decreases, beginning with the latest rights containing this condition and proceeding to the earliest rights containing this condition in the order of their priority dates, and after all of the rights containing this condition shall have been reduced to 75 percent of their decreed quantities, should the natural flow of the waters of the river decrease below the amount necessary to supply 75 percent of those decreed quantities, then this right and the other rights containing this condition, beginning with the latest and proceeding to the earliest, shall be reduced to 60 percent of their decreed quantities.

This right is diverted from the Boise River in the SWSE, Lot 2, S25, Twp. 5N, Rge. 5W, and injected into Sand Hollow Creek in the NWNW, Lot 6, S. 25, Twp. 5N, Rge. 5W for mitigation of irrigation use ~~Sand Hollow Creek~~ under Right Nos. ~~63-3201 and 63-9744~~ 63-33570 and 63-33571.

PRIORITY DATE: 06/01/1865

POINT OF DIVERSION:

Hi Dana,

Here are all of these again. Please look at the the Obendorf's rights which have had the mitigation language changed, the name on 63-178C now shows The lest Family LLLP and the change in the acre limitation on 63-33571.

The idea is to send these out for signature as soon as we get the correct signatory names for each from you. Then, if you get me a deed for the land under 63-178C with the name of The lest Family LLLP on it I can change our database. I wanted these circulating for signature asap so I changed the name in the overstrike/underline format for the SF5s.

Email Suzy or myself the names for signature on the cover sheets and we will get these out the door.

Thanks,
Jan

MEMORANDUM

DATE: December 5, 2008
TO: William Mulder
FROM: Scott King
CC: Scott Campbell
RE: November 19, 2008 Andrews Ditch Discharge Measurements

On November 19, 2008, discharge in Andrews Ditch was measured at three locations. Flow was measured with SPF's Pygmy current meter¹ mounted on a top-setter rod with data collected on a JBS Instruments' AquaCalc™ Pro. Measurements are summarized in Table 1 and depicted on the attached map.

Measurement Details

Location 1: A discharge of 40 cfs was measured about 340 feet downstream of point of diversion from Boise River. Although flow conditions were good with steady, even velocities, the ditch has some minor weedy vegetation and significant loose sediment deposits on the channel sides, with a harder sand bottom at mid-channel. Channel bottom conditions were better upstream, but flow conditions were not as good with unsteady, turbulent flows. Recommendations for future measurements include trying to identify an upstream point with less sediment and acceptable flow conditions, and/or using a rake or other tools to dislodge sediment and vegetation prior to measurement. Verticals were measured at 1 foot distances (in general) across the channel with single-point measurements (at 0.6 x depth) at shallow verticals and three-point measurements (at 0.2, 0.6, and 0.8 x depth) when depths exceeded 2 feet. Accuracy would generally be considered within 5% or better due to the many point measurements, but is estimated at +/- 5 to 10% because of the soft channel bottom and resulting difficulty in placing the current meter at the appropriate depth.

Location 2: A culvert pipe conveys flow from Andrews Ditch to an adjacent slough to the west. Because flow exiting the culvert was diffused, current-meter measurement would be quite difficult and was not attempted. Visual approximations were used to estimate a discharge of about 10 cfs. The culvert pipe size appeared to be between 18 and 24 inches in diameter, but size was not easy to confirm because the pipe has been deformed and was

nearly submerged. Review of culvert flow nomographs tend to confirm the 10 cfs discharge approximation. Estimates on discharge can be improved by confirming culvert diameter, length, and type and inspecting condition when the canal is dry. Flows could be measured with a current meter if the channel below culvert discharge was modified to create a single, defined channel for a distance of about 10 to 15 feet.

Loc ID	Location Description	Discharge (cfs)	Estimated Accuracy	Notes
1	340 ft below Boise River Point of Diversion (43.735476N, 116.879357W)	40	+/- 5 to 10%	Soft channel bottom on edges, some weeds. Discharge measured with current meter.
2	Culvert overflow to slough, about 0.9 miles below POD (43.744186N, 116.888575W)	10 (est)	+/- 50%	Visual estimate and culvert-equation discharge approximations.
3a	Discharge passing first turnout, about 1.2 miles below POD (43.74654N, 116.891898W).	15.3	+/- 10%	Measured flow passing through "notch" in concrete check structure with current meter.
3b	Overflow to Sand Hollow Creek	6.9	+/- 10%	Discharge over check boards measured with contracted rectangular weir equation, L = 3.25 ft, H = 0.77 ft.
4	Andrews Ditch at Tree Top Ranch about 75 feet below highway culvert (43.748314N, 116.912791W).	13.1 cfs	+/- 3 to 5%	Discharge measured with current meter. Good location and flow conditions.

Table 1: Summary of Andrews Ditch Discharge Measurements.

Location 3: A discharge of 15.3 cfs was passing through the first check structure and continuing down Andrews Ditch. The current meter measurements were taken in the rectangular "notch." Although this location was not ideal as flows were converging into the notch from the sides and bottom, it appeared to be the best available location for

¹ Gurley Precision Instruments, Model No. 625, Serial No. AR2072.

measurement. Depths in the ditch below the check were too great for safe wading. The notch was 4.6 feet wide, and verticals were taken using the three-point method at 0.5 foot distance increments. Flow depth was 2 feet. A tarp dam was being used to prevent flow from entering the concrete ditch on the north side. Overflow from the ditch to Sand Hollow Creek was flowing over check boards and this discharge is estimated at 6.9 cfs using the contracted rectangular weir formula for a crest length of 3.25 feet and flow depth of 0.77 feet. Although flow was freely discharging over the check structure, the structure is not a "standard" contracted rectangular weir and therefore accuracy is somewhat questioned and estimated at +/- 10%. Although it appears from the downstream side that a low-level "notch" allows additional flow to pass under the check, this notch was probed with a long steel bar found at the site. This probing indicated that the notch is plugged and I could not find any sign of significant flow discharging below the check boards.

Location 4: A discharge of 13.1 cfs was measured in Andrews Ditch as it enters Tree Top Ranches property using the current meter. Verticals were measured at 0.5 foot distances with single-point (0.6 x depth) methods. Accuracy of this measurement is expected to be "good." Flow was even and steady and channel conditions were acceptable.

Conveyance Losses / Unaccounted Flow

Assuming that the measurement of 15 cfs passing the first check structure is reasonably accurate, it appears that losses and/or diversions from the ditch from this point to Tree Top Ranches were approximately 2 cfs as 13 cfs was measured entering the property.

There appears to be more significant unaccounted-for water losses and/or inaccurate measurements or estimates above the first check structure. The total flow at the first check structure was 22 cfs. About 10 cfs was being discharged at the upstream culvert. With 40 cfs measured at the most upstream point, about 8 cfs remains unaccounted for. All or a portion of this 8 cfs may be associated with a combination of conveyance losses, measurement inaccuracies, and incorrect estimates of culvert flow.

Subject: RE: Obendorf Mitigation Remarks

Jan~
I just looked at -3201 & -9744. They are both solely for irrigation. That changes my recommended edit slightly. Couldn't we just say "mitigating Sand Hollow Creek Right Nos. 63-3201 & 63-9744"? Or merely, "mitigation right nos. 63-3201 & 63-9744"?

Hi,

That sounds fine. I won't be here Thursday or Friday, but the late report won't be completely put together until the middle of next week. I will have time to review anything you may have and make adjustments, if needed, on Tuesday. No worries, as Garrick would say.

Thanks,
Jan

To: Courtney, Andrea
Subject: Obendorf Mitigation Remarks

Hi Andrea,

I am trying to put on a remark that explains what this right is being mitigated for – in general terms. My idea is to put the point of diversion from the Boise River and the point of injection into Sand Hollow Creek with no points of rediversion. I can only do this if I explain it in the remarks.

I think this method is actually safer for the Department since I won't be showing pods upstream from the injection point. The mitigation is to downstream users on Sand Hollow Creek getting the benefits of the Boise River water. This is actually what has historically been happening.

How does this sound:

This right is diverted from the Boise River in the SWSE, S.25, Twp. 5N, Rge. 5W, and injected into Sand Hollow Creek in the NWNW, S.25, Twp. 5N, Rge. 5W, ~~to be used~~ for mitigation ~~on~~ of the irrigation ~~portions of~~ use ~~under of~~ Sand Hollow Creek Right Nos. 63-3201 an 63-9744.

Mark it and correct it or just change it. I decided to go simple.

Thanks,
Jan

TRIBUTARY: SNAKE RIVER

QUANTITY: 3.200 CFS

This right is diverted from the Boise River in the SWSE, S25, Twp. 5N, Rge. 5W, and injected into Sand Hollow Creek in the NWNW, S. 25, Twp. 5N, Rge. 5W, to be used for mitigation of the irrigation use under Right Nos. 63-3201 and 63-9744 from Sand Hollow Creek.

Whenever it becomes necessary for the watermaster to deliver this right the following condition shall apply. This right shall receive 100 percent of its decreed quantity until the natural flow of the waters of the Boise River shall decrease so that all rights containing this condition cannot receive 100 percent of their decreed quantities, at which time this right and the other rights containing this condition shall first be cut to 75 percent of their decreed quantities, as the natural flow of the river decreases, beginning with the latest rights containing this condition and proceeding to the earliest rights containing this condition in the order of their priority dates, and after all of the rights containing this condition shall have been reduced to 75 percent of their decreed quantities, should the natural flow of the waters of the river decrease below the amount necessary to supply 75 percent of those decreed quantities, then this right and the other rights containing this condition, beginning with the latest and proceeding to the earliest, shall be reduced to 60 percent of their decreed quantities.

OTHER PROVISIONS NECESSARY FOR DEFINITION OR ADMINISTRATION OF THIS WATER RIGHT:

This right is a split of Right No. 63-160 which is also designated as Right No. 28 in the Boise River Stewart Decree and Boise River Water Distribution Report.

This partial decree is subject to such general provisions necessary for the definition of the rights or for the efficient administration of the water rights as may be ultimately determined by the Court at a point in time no later than the entry of a final unified decree. Section 42-1412(6), Idaho Code.

EXPLANATORY MATERIAL: BASIS OF CLAIM - Decreed

Right includes accomplished change in place of use pursuant to Section 42-1425, Idaho Code.

Right includes accomplished change in purpose of use pursuant to Section 42-1425, Idaho Code.

1. C18 This partial decree is subject to such general provisions necessary for the definition of the rights or for the efficient administration of the water rights as may be ultimately determined by the Court at a point in time no later than the entry of a final unified decree. Section 42-1412(6), Idaho Code.
2. K06 This right is limited to the irrigation of 167 acres within the place of use described above in a single irrigation season.
3. The source of this water right includes waste water. The right remains subject to the right of the original appropriator, in good faith and in compliance with state laws governing changes in use and/or expansion of water rights, to cease wasting water, to change the place or manner of wasting it, or to recapture it.
4. S39 The use of water for irrigation under this right may begin as early as March 1, provided other elements of the right are not exceeded. The use of water before March 15 under this remark is subordinate to all water rights having no subordinated early or late irrigation use and a priority date earlier than the date a partial decree is entered for this right.
5. Sand Hollow Creek is also known as Cole Slough, Sand Hollow Drain, and Sand Run Gulch.

MEMORANDUM

DATE: December 5, 2008
TO: William Mulder
FROM: Scott King
CC: Scott Campbell
RE: November 19, 2008 Andrews Ditch Discharge Measurements

On November 19, 2008, discharge in Andrews Ditch was measured at three locations. Flow was measured with SPF's Pygmy current meter¹ mounted on a top-setter rod with data collected on a JBS Instruments' AquaCalc™ Pro. Measurements are summarized in Table 1 and depicted on the attached map.

Measurement Details

Location 1: A discharge of 40 cfs was measured about 340 feet downstream of point of diversion from Boise River. Although flow conditions were good with steady, even velocities, the ditch has some minor weedy vegetation and significant loose sediment deposits on the channel sides, with a harder sand bottom at mid-channel. Channel bottom conditions were better upstream, but flow conditions were not as good with unsteady, turbulent flows. Recommendations for future measurements include trying to identify an upstream point with less sediment and acceptable flow conditions, and/or using a rake or other tools to dislodge sediment and vegetation prior to measurement. Verticals were measured at 1 foot distances (in general) across the channel with single-point measurements (at 0.6 x depth) at shallow verticals and three-point measurements (at 0.2, 0.6, and 0.8 x depth) when depths exceeded 2 feet. Accuracy would generally be considered within 5% or better due to the many point measurements, but is estimated at +/- 5 to 10% because of the soft channel bottom and resulting difficulty in placing the current meter at the appropriate depth.

Location 2: A culvert pipe conveys flow from Andrews Ditch to an adjacent slough to the west. Because flow exiting the culvert was diffused, current-meter measurement would be quite difficult and was not attempted. Visual approximations were used to estimate a discharge of about 10 cfs. The culvert pipe size appeared to be between 18 and 24 inches in diameter, but size was not easy to confirm because the pipe has been deformed and was

nearly submerged. Review of culvert flow nomographs tend to confirm the 10 cfs discharge approximation. Estimates on discharge can be improved by confirming culvert diameter, length, and type and inspecting condition when the canal is dry. Flows could be measured with a current meter if the channel below culvert discharge was modified to create a single, defined channel for a distance of about 10 to 15 feet.

Loc ID	Location Description	Discharge (cfs)	Estimated Accuracy	Notes
1	340 ft below Boise River Point of Diversion (43.735476N, 116.879357W)	40	+/- 5 to 10%	Soft channel bottom on edges, some weeds. Discharge measured with current meter.
2	Culvert overflow to slough, about 0.9 miles below POD (43.744186N, 116.888575W)	10 (est)	+/- 50%	Visual estimate and culvert-equation discharge approximations.
3a	Discharge passing first turnout, about 1.2 miles below POD (43.74654N, 116.891898W).	15.3	+/- 10%	Measured flow passing through "notch" in concrete check structure with current meter.
3b	Overflow to Sand Hollow Creek	6.9	+/- 10%	Discharge over check boards measured with contracted rectangular weir equation, L = 3.25 ft, H = 0.77 ft.
4	Andrews Ditch at Tree Top Ranch about 75 feet below highway culvert (43.748314N, 116.912791W).	13.1 cfs	+/- 3 to 5%	Discharge measured with current meter. Good location and flow conditions.

Table 1: Summary of Andrews Ditch Discharge Measurements.

Location 3: A discharge of 15.3 cfs was passing through the first check structure and continuing down Andrews Ditch. The current meter measurements were taken in the rectangular "notch." Although this location was not ideal as flows were converging into the notch from the sides and bottom, it appeared to be the best available location for

¹ Gurley Precision Instruments, Model No. 625, Serial No. AR2072.

measurement. Depths in the ditch below the check were too great for safe wading. The notch was 4.6 feet wide, and verticals were taken using the three-point method at 0.5 foot distance increments. Flow depth was 2 feet. A tarp dam was being used to prevent flow from entering the concrete ditch on the north side. Overflow from the ditch to Sand Hollow Creek was flowing over check boards and this discharge is estimated at 6.9 cfs using the contracted rectangular weir formula for a crest length of 3.25 feet and flow depth of 0.77 feet. Although flow was freely discharging over the check structure, the structure is not a "standard" contracted rectangular weir and therefore accuracy is somewhat questioned and estimated at +/- 10%. Although it appears from the downstream side that a low-level "notch" allows additional flow to pass under the check, this notch was probed with a long steel bar found at the site. This probing indicated that the notch is plugged and I could not find any sign of significant flow discharging below the check boards.

Location 4: A discharge of 13.1 cfs was measured in Andrews Ditch as it enters Tree Top Ranches property using the current meter. Verticals were measured at 0.5 foot distances with single-point (0.6 x depth) methods. Accuracy of this measurement is expected to be "good." Flow was even and steady and channel conditions were acceptable.

Conveyance Losses / Unaccounted Flow

Assuming that the measurement of 15 cfs passing the first check structure is reasonably accurate, it appears that losses and/or diversions from the ditch from this point to Tree Top Ranches were approximately 2 cfs as 13 cfs was measured entering the property.

There appears to be more significant unaccounted-for water losses and/or inaccurate measurements or estimates above the first check structure. The total flow at the first check structure was 22 cfs. About 10 cfs was being discharged at the upstream culvert. With 40 cfs measured at the most upstream point, about 8 cfs remains unaccounted for. All or a portion of this 8 cfs may be associated with a combination of conveyance losses, measurement inaccuracies, and incorrect estimates of culvert flow.

Re: SRBA Claim No. 63-160

Dear Ms. Shurte:

On behalf of Greg and Ann Obendorf (the "Obendorfs") and pursuant to Sections II(B)(3) and II(E)(2) of the Settlement Agreement among Tree Top Ranches L.P., the Obendorfs, The Tina Iest Family L.L.L.P., THEDRAKE LLC, and the Hauck Family Revocable Trust, I conditionally amend the quantity element of the Obendorfs' SRBA Claim No. 63-160 from the original 7.0 cubic feet per second ("cfs") claimed down to 3.2 cfs. Pursuant to the Settlement Agreement, the Obendorfs' amendment of SRBA Claim No. 63-160 is conditioned upon *inter alia* final IDWR approval of the Settlement Agreement which approval remains unfinalized. The Settlement Agreement requires that the Obendorfs amend SRBA Claim 63-160 by today, May 12, 2011. In balancing the Obendorfs' obligation to amend SRBA Claim No. 63-160 under the Settlement Agreement with the unfinalized IDWR approval of the Settlement Agreement, I submit this conditional request for amendment of SRBA Claim No. 63-160 subject to final IDWR approval of the Settlement Agreement.

Please let me know if you have any questions or suggestions about this matter.
Thank you.

Sincerely,

RE: Snake River Basin Adjudication (SRBA)
Notice of Claim to a Water Right #63-160
Your Clients: Greg and Ann Obendorf

Dear Mrs. Hofstetter:

The Notice of Claim to a Water Right you filed for your clients referenced above was received from the SRBA Court recently. I have enclosed receipt #C088706 for the fees your firm paid. Please retain the receipt for your records.

Your clients' Notice of Claim will be investigated and reported to the Court in a future supplemental Director's Report. Please contact me at 208/287-4916 if you have any questions.

Sincerely,

Craig L. Saxton
Water Rights Supervisor
