Jim

I found a working file at home last nite concerning 47-C and I think I found the letter you referenced. I believe the letter in question that I did not send out was actually a working draft of the letter that I sent on June 6, 1995. Therefore, the letter that the user referenced was actually sent in 1995. I will have Dayna fax you a copy of the letter. It is sort of long letter that allowed for monitoring/measuring stream flows above and below the diversions located above the reservoir - again with the theory being that this would show return flows essentially equal to diversions or stream flow above the diversions. Cedar Mesa approved of the approach and the scheme was applicable to 1995 only. I don't believe though that it was actually implemented. I would favor this approach again but I think the users need to agree to it again and then IDWR can do NOV's if the users above the reservoir do not implement.

Tim
