## **Water Year 1998 Water Report**

The water year started to look as though we were going to have a below average water year with the snow pack never getting to 100 percent of the 30 year average. However we had a good carry over of storage water from the previous water year and good soil moisture after 3 years of average or above precipitation.

Then in March we started to get rains and began to draft water out of the reservoir to prepare for spring runoff. this wet cycle continued though May and it turned our water supply around to the point that we had to discharge most of the water down the river rather than use it for irrigation.

There was no water delivered until late May and most of the farmers did not irrigate their alfalfa until after 1<sup>st</sup> cutting. Then it was a normal water delivery for the rest of the summer.

The total runoff for the basin was 164,000 acre feet with 34,000 acre feet delivered to the farms and town lots. This is about 150% of the normal runoff and about 80% of the normal water use.

1998 saw more ground converted to sprinkler irrigation and the crop rotation remains about the same through out the district. The district is now well over 80% sprinkler irrigated compared to less than 10% 20 years ago. Most of this is a result of the long drought that we saw in this area in the late 1980's and early 1990's. With this changing of the irrigation methods in the district we are a good water supply even in the short water years. However one has to wonder what is happening to the under ground aquifer with not near as much water being spread out over the valley. Perhaps we need to look at a managed recharge program to maintain our ground water level at where it should be.
